Hence, specifically—(b) A frame or panel of wood or iron or other strong material used as a cover, usually for a window, in order to shut out the light, to prevent spectators from seeing the interior, or to serve as a protection for the aperture. There are inside and outside shutters. Inside shutters are usually in several hinged pieces which fold back into a recessed casing in the wall called a *box*. The principal piece is called the *front shutter*, and the auxiliary piece a *back flap*. Some shutters are arranged to be opened or closed by a sliding movement either horizontally or vertically, and others, particularly those for shops, are made in sections, so as to be entirely removable from the window. Shutters for shop-fronts are also made to roll up like curtains, to fold like Venetian blinds, etc.

2. An instrument used by weavers for passing or shooting the thread of the weft from one side of the web to the other between the threads of the warp. The modern shuttle is a sort of wooden carriage tapering at each end, and hollowed out in the mid-

dle for the reception of the bobbin or pirn on which the weft is wound. The weft unwinds from this bobbin as the shuttle runs from one side of the web to the other. It is driven across by a smart blow from a pin called a *picker* or *driver*. There is one of these pins on each side of the loom, and the two are connected by a cord to which a handle is attached. Holding this handle in his right hand, the weaver moves the two pins together in each direction alternately by a sudden jerk. A shuttle propelled in this manner is called a *fly-shuttle*, and was invented in 1738 by John Kay, a mechanic of Colchester, England. Before this invention the weaver took the shuttle between the finger and thumb of each hand alternately and threw it across, by which process much time was lost. There are also a great variety of automatic picker-motions for driving the shuttles of looms. Compare *picker-motion*.

of upper rollers. The shuttle has also a pair of under

rollers, one at each end, and travels over the lower series

of warp-threads through the shed, being pushed along by

the carriage while the warp-threads are passed, without

straining them, between the upper rollers of the carriage

and the rollers of the shuttle. Compare *positive-motion*

Different writers mention from one to twelve sibyls, but the number commonly reckoned is ten, enumerated as the Persian or Babylonian, Libyan, Delphian, Cimmerian, Erythrean, Samian, Cumæan, Hellespontine or Trojan, Phrygian, and Tiburtine. Of these the most celebrated was the Cumæan sibyl (of Cumæ in Italy), who, according to the story, appeared before Tarquin the Proud and offered him nine books for sale. He refused to buy them, whereupon she burned three, and offered the remaining six at the original price. On being again refused, she destroyed three more, and offered the remaining three at the price she had asked for the nine. Tarquin, astonished at this conduct, bought the books, which were found to contain directions as to the worship of the gods and the policy of the Romans. These sibylline books, or books professing to have this origin, written in Greek hexameters, were kept with great care at Rome, and consulted from time to time by oracle-keepers under the direction of the senate. They were destroyed at the burning of the temple of Jupiter in 83 n. c. Fresh collections were made, which were finally destroyed soon after A. D. 400. The Sibylline Oracles referred to by the Christian fathers belong to early ecclesiastical literature, and are a curious mixture of Jewish and Christian material, with probably here and there a snatch from the older pagan source. In composition they seem to be of various dates, from the second century before to the third century after Christ.

Sick, Ill, Ailing, Unwell, Diseased, Morbid, Sickly*. *Sick* and *ill* are general words for being positively out of a healthy state, as *ailing* and *unwell* are in some sense negative and therefore weaker words for the same thing. There has been some tendency in England to confine *sick* to the distinctive sense of 'nauseated,' but in America the word has continued to have its original breadth of meaning, as found in the Bible and in Shakespeare. *Diseased* follows the tendency of *disease* to be specific, as in *diseased lungs*, or a *diseased leg*—that is, lungs or a leg affected by a certain disease; but the word may be used in a general way. *Morbid* is a more technical or professional term, indicating that which is not healthy or does not act in a healthy way; the word is also the one most freely used in figurative senses: as, *morbid sensitiveness*, *self-consciousness*, or *irritability*. *Sick* and *ill* apply to a state presumably temporary, however severe; *sickly* indicates a state not quite equal to sickness, but more permanent, because of an underlying lack of constitutional vigor. See *illness*, *debility*, *disease*.

It is characterized by monocious flowers, with broadly bell-shaped or flattened five-toothed calyx, and five-parted wheel-shaped corolla, the stamens in the male flowers united into a short column bearing from two to five sessile curved or flexuous anthers. The ovary in the female flowers is bristly or prickly, and is crowned with a short style divided into three stigmas, producing a small flattened coriaceous or woody fruit with acute or long-beaked apex, commonly set with many sharp needles, and filled by a single large seed. There are about 31 species, natives of warm parts of America, one, *S. angulatus*, extending to Kansas and Canada, found also in Australia and New Zealand. They are smooth or rough-hairy climbers, or sometimes prostrate herbs, and bear thin, angled leaves, three-cleft tendrils, and small flowers, the fertile commonly clustered at the base of a staminate raceme. For *S. angulatus*, see *one-seeded* or *star cucumber*, under *cucumber*.

**Sida** (sī'dā), *n.* [NL. (Linnaeus, 1737), *< Gr. σῖδα*, the pomegranate, a water-lily, also, in Theophrastus, a plant of the genus *Althæa* or other malvaceous plant.] 1. It is characterized by solitary pendulous ovules and an ovary of a single ring of five or more carpels, which finally fall away from the axis and are each without appendages and indehiscent, or are sometimes at the summit two-valved, brittle-tipped or beaked. There are about 90 species, natives of warm climates, mostly American, with about 23 in Australia and 8 in Africa and Asia. They are either herbs or shrubs, generally downy or woolly, and bearing flowers sometimes large and variegated, but in most species small and white or yellow. **side** (sīd), *n.* and *a.* [*< ME. side, syde, rarely sithe, < AS. side = OS. sida = OFries. side =*

Cf. *beside*, *besides*.] I. n. 1. One of the two terminal surfaces, margins, or lines of an object or a space situated laterally to its front or rear aspect; a part lying on the right or the left hand of an observer, with reference to a definite point of view: as, the *sides* of a building (in contradistinction to its front and rear or back, or to its ends); the *sides* of a map or of a bed (distinguished from the top and bottom, or from the head and foot, respectively).

2. Specifically, with reference to an animal body: (a) Either half of the body, right or left, which lies on either hand of the vertical median longitudinal plane; the entirety of any lateral part or region: as, the right *side*; the left *side*. (b) The whole or a part of the body in front of or behind a vertical transverse plane: as, the front *side*; the hinder *side*; the dorsal *side*. (c) A part of the body lying laterally with reference to any given or assumed axis, and opposed to another similar or corresponding part: as, the front or back *side* of the arm. (d) A surface or extent of any body, or part of any body, that is external or internal, considered with reference to its opposite: as, the inner or outer *side*. See *inside*, *outside*. (e) Especially, that part of the trunk of an animal which lies or extends between the shoulder and the hip, and particularly the surface of such part; the lateral region or superficies of the chest and belly.

Lest you the Softness of the Sex forsake.

*Congress*, tr. of Ovid's Art of Love, iii.

(f) One of the two most extensive surfaces of anything, being neither top or bottom, nor end, nor edge or border. [Since every organism, like any other solid, has three dimensions, to the extent of which in opposite directions *side* may be applied, it follows that there are three pairs of sides, the word having thus three definitions: a fourth sense is that which relates to the exterior and the (often hollow) interior; a fifth is a definite restriction of right and left *sides*; and a sixth is a loose derived application of the word, without reference to any definite axes or planes.]

3. One of the continuous surfaces of an object limited by terminal lines; one of two or more bounding or investing surfaces; a superficial limit or confine, either external or internal: as, the six *sides* of a cube. (but in geometry the word is not thus used for *face*, but as synonymous with *edge*); the *side* of a hill or mountain (hillside, mountain-side); the upper and under *sides* of a plank; the right and wrong *sides* of a fabric or garment (see phrase below); the *sides* of a cavern or a tunnel. The word *side* may be used either of all the bounding surfaces of an object, as with certain prisms, crystals, and geometrical figures, or as exclusive of parts that may be called *top*, *bottom*, *edge*, or *end*, as with a cubical box, a plank, etc.

Men seith that dune-is [hill's] *sithen* on  
Was mad temple salamon.

That crawls along the *side* of yon small hill.  
*Milton*, *Comus*, l. 295.

4. One of the extended marginal parts or courses of a surface or a plane figure; one of any number of distinct terminal confines or lateral divisions of a surface contiguous to or continuous with another surface: as, the opposite *sides* of a road or a river; the east and west *sides* of the ocean; all *sides* of a field. The outer parts of an oblong or an irregular surface may all be called *sides*, or distinguished as the long and short *sides*, or as *sides* and *ends*, according to occasion. *Side* in this sense is more comprehensive than *margin*, *edge*, *border*, or *verge* (commonly used in defining it), since it may be used so as to include a larger extent of contiguous surface than any of these words. Thus, the *sides* of a room may be all the parts of its floor-space not comprised in a central part reserved or differentiated in some special way. The *sides* of a table are those marginal parts upon which food is served. The east and west *sides* of a continent may constitute jointly the whole of it, or may consist of larger or smaller mar-

ginal strips or divisions, according as they are considered as separated by a mesial line or by some intervening region. The amount of latitude with which the word may be used in particular cases does not admit of definitive discrimination; but there is usually no difficulty in determining the intention of a writer or speaker in his employment of it.

A great market-place  
Upon two other *sides* fills all the space.  
*William Morris*, *Earthly Paradise*, I. 4.

5. Position or place with reference to an intermediate line or area; a space or stretch divided from another by the limit or course of something: preceded by *on* and followed by *of*, either expressed or (sometimes) understood: as, a region *on both sides* of a river; we shall not meet again *this side* the grave.

For we will not inherit with them *on yonder side* Jordan, or forward; because our inheritance is fallen to us *on this side* Jordan eastward. *Num.* xxxii. 19.

*Steele*, *Spectator*, No. 282.

6. A part of space or a range of thought extending away from a central point; any part of a surrounding region or outlook; lateral view or direction; point of compass: as, there are obstacles *on every side*; to view a proposition from all *sides*.

The crimson blood  
Circles her body *in on every side*.  
*Shak.*, *Lucrece*, l. 1739.

Fair children, borne of black-faced ayahs, or escorted by their bearers, prattled *on all sides*.  
*W. H. Russell*, *Diary in India*, I. 213.

7. An aspect or part of anything viewed as distinct from or contrasted with another or others; a separate phase; an opposed surface or view (as seen in the compounds *inside* and *outside*): as, the *side* of the moon seen from the earth; a character of many *sides*; to study all *sides* of a question; that *side* of the subject has been fully heard.

As might be expected from his emotional nature, his pathetic *side* is especially strong.

*A. Dobson*, *Selections from Steele*, Int., p. xlv.

8. Part or position with reference to any line of division or separation; particular standing on a subject; point of view: as, to take the winning *side* in politics, or one's *side* of a dispute; there are faults *on both sides*.

Pertaining or relating to the constellations or fixed stars; consisting of or constituted by fixed stars: as, the *sidereal* regions; *sidereal* calculations; a *sidereal* group or system. *Sidereal* distinctively refers rather to stars in the aggregate or as arranged in constellations or groups than to a star considered singly. It is, therefore, not a precise synonym of *stellar* or *astral*, and still less, of course, of *starry*; although in many phrases it is interchangeable with *stellar*. Thus, the "*sidereal* spaces" are the "*stellar* spaces," and "*sidereal* gold" is "*starry* spangles."

**Sidereal clock or chronometer**, a clock or chronometer that keeps sidereal time.—**Sidereal day, hour, month**. See the nouns.—**Sidereal magnetism**, according to the believers in animal magnetism, the influence of the stars upon patients. *Imp. Dict.*—**Sidereal system**, the system of stars. The solar system is considered a member of the sidereal system, in the same sense as the earth with its moon, and Saturn with its satellites, are considered members of the solar system.—**Sidereal time**, time as measured by the apparent diurnal motion of the stars. The sidereal day, the fundamental period of sidereal time, is taken to begin and end with the passage over the meridian of the vernal equinox, the first point of Aries, or the origin of right ascension (three names for the same thing). There is just one more sidereal than mean solar day in a sidereal year. The sidereal day is 3m. 55.91s. shorter than a mean solar day. The sidereal time of mean noon is 0 hours on March 22d (21st, leap-years), 6 hours on June 21st, 12 hours on September 20th (21st, years preceding leap-years), and 18 hours on December 21st (20th, leap-years). These dates are for the meridian of Washington. For Greenwich it is 0 hours on March 22d in all years, and 6 hours on June 22d in years preceding leap-years. Sidereal time is the only uniform standard of time-measurement; and this cannot be absolutely uniform, since the friction of the tides must tend to retard the motion of the earth.—**Sidereal year**, the time in which the earth makes one complete revolution round the sun. The ratio of the sidereal year to the tropical year is that of unity to unity minus the quotient of the yearly precession by 360°—that is, it is longer than the tropical year by 20m. 23.3s.; its length is thus 365 days 6 hours 9 minutes 9.5 seconds.

It is one of the important ores of iron. Also called *chalybite*, *spathic* or *sparry iron*, *junkerite*, *junkerite*. The term *siderite* is used only as meaning chalybite, spathic iron, or carbonate of iron by scientific men at the present time.

**Sideritis** (sid'g-rī'tis), *n.* [*NL.* (Tournefort, 1700), *< L. sideritis*, vervain, *< Gr. σιδῆρης*, an uncertain herb, fem. of *σιδῆρης*, of iron: see *siderite*.] A genus of gamopetalous plants of the order *Labiata*, tribe *Stachydeæ*, and subtribe *Marrubieæ*. It is characterized by flowers with a five-toothed tubular calyx within which the corolla-tube, stamens, and style are all included, a corolla with the upper lip flattish and the lower with a larger middle lobe,

There are about 45 species, natives of the Mediterranean region, abundant in western Asia and extending west to the Canaries. They are herbs or shrubs, usually densely woolly or velvety, with entire or toothed leaves, and small and generally yellowish flowers in axillary whorls or crowded into a dense spike. **siderography** (sid'g-rō-grā-fi), *n.* [*< Gr. σιδῆρος*, iron, + *γραφία*, *< γράφω*, write.] The art or practice of engraving on steel: particularly applied to the transfer process of Perkins. In this process the design is first engraved on a steel block, which is afterward hardened, and the engraving transferred to a steel roller under heavy pressure, the roller being afterward hardened and used as a die to impress the engraving upon the printing-plate.

**siderolite** (sid'g-rō-līt), *n.* [*< Gr. σιδῆρος*, iron, + *λίθος*, stone.] 1. A name first given by N. S. Maskelyne (in the form *aeōro-siderolite*) to those meteorites which G. Rose had previously called *pallasites*. For meteorites consisting chiefly of metallic (nickeliferous) iron the name *siderite* was proposed by C. U. Shepard, and that of *holosiderite* by Deauville; but the former is not admissible, because this name was long ago preoccupied by a well-known and widely distributed mineral species, and the latter cannot be accepted, because the majority of the specimens so designated are not wholly of iron. The name *siderolite* has therefore been transferred by M. E. Wadsworth to those meteorites which are composed chiefly of iron—in most cases, however, including more or less irregular and nodular masses of pyrrhotite, schreibersite, graphite, etc. The same author includes in *siderolite* masses of iron of similar character although of terrestrial origin, as those of Ovitak in Greenland. See *meteorite*, under which the meaning of *pallasite* is given.

There are 60 or 70 species, widely scattered through the tropics, a few occurring beyond them, in South Africa, Australia, and New Zealand, and one in Madeira. They are trees or shrubs, either smooth or hairy, bearing thin and veiny but rigid leaves, destitute of stipules. The somewhat bell-shaped and usually small flowers are borne in sessile or pedicelled axillary clusters, which are commonly white or whitish. The species are known in general as *ironwood*, especially *S. Capense* of Cape Colony. One yellow-flowered species extends into Florida, for which see *mastic-tree*. For *S. australis*, the wycailie of the native Australians, see *wild plum* (e), under *plum*. *S. rugosum* is known in Jamaica as *beef-apple* and *bull-apple tree*, and bears large yellowish berries with a rigid rind. *S. dulcificum*, of the coast of western Africa, is there called *intraculous-berry* by English residents, from the duration of its sweet flavor upon the palate.

**Drum-sieve**, a kind of sieve in extensive use among druggists, dyers, and confectioners: so named from its form. It is used for sifting very fine powders, and consists of three parts or sections, the top and bottom sections being covered with parchment or leather, and made to fit over and under a sieve of the usual form, which is placed between them. The substance to be sifted being thus closed in, the operator is not annoyed by the clouds of powder which would otherwise be produced by the agitation, and the material sifted is at the same time saved from waste.—*Sieve and shears*, an old mode of divination. See *ecvrimancy*.

Another piece covers all those divisible by 3; and so on until all but the prime numbers are covered.

See *reflecting*.—*Second sight*, a faculty of internal sight supposed to be possessed by some persons, whereby they see distant objects or occurrences, or foresee future events, as if present before their eyes; so called because it takes the place of natural sight, which for the time is in abeyance. In modern Europe they abound most among people of Celtic origin, and especially those of the Highlands and islands of Scotland. See *clairvoyance*.—*Slit-bar-sight*. Compare *helmet*, *haume*, *armet*, *basinet*, *lunette*, *celliere*.

**Sigillaria** (sij-i-lā' ri-i), *n.* [*NL. (Brongniart, 1822), < L. sigillum*, a seal; see *sigil*.] A genus of very important and widely spread fossil plants which occur in the (Carboniferous) coal-measures, and which are especially characteristic of the middle section of the series. *Sigillaria* is a tree often of large size, and chiefly known by the peculiar markings on the trunk, which in some respects resemble those which characterize *Lepidodendron*. These markings are leaf-scars, and they occur spirally distributed around the stem, and generally arranged on vertical ridges or ribs. Great numbers of species have been described, the variations in the form and arrangement of the leaf-scars and of the vascular scars being the points chiefly relied on for specific distinction. *Sigillaria* is but imperfectly known, so far as foliage and fruit are

concerned, but most paleobotanists consider it probable that it will be eventually proved to be closely related to *Lepidodendron*; others refer it to the cycads; while there are some who maintain that it is probable that various plants quite different from one another in their systematic position have been included under the name *Sigillaria*.

**sigillarian** (sij-i-lā'-ri-ān), *a.* Belonging to or related to *Sigillaria*.

The author has demonstrated a peculiarity in the origin of the medulla of the *Sigillarian* and *Lepidodendroid* plants.

The significance of the last terms is that the values  $m = n = 0$  are to be excluded in forming the sum.

2. An arbitrary or conventional mark used as an abbreviation for a known meaning; a figure written technically instead of the word or words which it represents, according to prescription or usage; as, mathematical, astronomical, medical, botanical, or musical signs; occult signs; an artist's sign. The most common mathematical signs are those indicating the relations of quantities in arithmetical and algebraic processes. (See *notation*.) 2. The principal astronomical signs are those representing the names of the twelve divisions or constellations of the zodiac. (See *def. 11*.) Others symbolize the sun, the earth, and the other planets, the moon and its different phases, and the first twenty or more of the asteroids or planetoids. (See *symbol*.) All these, as well as the zodiacal signs, are in form significant of the names or the bodies for which they stand. The eight aspects have also signs, as follows: ☿ conjunction, ☊ opposition, ☌ trine, ☐ quadrature, ☿ sextile, and three others very rarely used. In zoology two astronomical signs, ♀ and ♂, of Mars and Venus, are constantly used to denote male and female respectively; to which is sometimes added a plain circle, O, meaning a young animal of undetermined sex. These signs for sex are in a good many of the cuts of insects figured in this volume (see, for example, *silk-spider*). In botany ☉ indicates a monocarpal plant; ☿, an annual; ♀, a biennial; ☌, a perennial; ♀, a shrub; ☌, a tree; ☌, a male plant or flower; ☌, a female plant or flower; ☌, a hermaphrodite plant or flower; ☌, indefinitely numerous; ☌, cotyledons accumbent; ☌, cotyledons incumbent, etc. The following signs are in common use in medicine and pharmacy: ℞, recipe; ℥, ounce; ℥, fluidounce; ℥, dram; ℥, fluidmchm; ℥, scruple; ℥, minim.

tavern-sign; a swinging sign; a tin sign; a sign-board. Places of business, and especially taverns, were formerly often known by the names of the figures or representations used by them for signs, as the Cock and Bull for a tavern, the Bible and Keys for a bookstore, etc.

**Specifically**—2. An external natural marking upon, or a symbolical appearance or characteristic of, a plant, mineral, or other object or substance, formerly supposed by the Paracelsians (and still by some ignorant persons) to indicate its special medicinal quality or appropriate use. The medical theory based upon this conception, known as the *doctrine of signatures*, took note of color (as yellow flowers for jaundice and the bloodstone for hemorrhage), shape (as that of the roots of mandrake and ginseng), various peculiarities of marking, etc. Many existing names of plants, minerals, etc., originated from this theory. See *Kidneywort*, *mandrake*, *scorpion-grass*. Also called *sign*, *seal*, and *sigil*.

Some also, pretending themselves *Natures Principall Secretaries*, have found out [in certain plants] . . . *Signatures* of *Natures* owne Impression, fitted to their several and speciall uses in Physicke. *Purchas*, *Pilgrimage*, p. 505.

W. K. Clifford, *Lectures*, I. 130.

3. The name of a person, or something used as representing his name, affixed or appended to a writing or the like, either by himself or by deputy, as a verification, authentication, or assent (as to a petition or a pledge). The initials, the first or familiar name by which one is known, or the mark or sign of the cross, and the like, if affixed by the person for that purpose, is a legal signature. A British peer uses his title as signature: thus, the Marquis of Salisbury signs himself simply "Salisbury." Prelates of the Church of England adopt signatures from the Latinized designations of their sees: thus, the Archbishop of Canterbury (E. W. Benson) signs himself "E. W. Cantuar.," the Bishop of Oxford (W. Stubbs), "W. Oxon." See *sign*, *v. t.*, 2, 3.

4. In *Scots law*, a writing formerly prepared and presented by a writer to the signet to the baron of exchequer, as the ground of a royal grant to the person in whose name it was presented. This, having in the case of an original charter the sign manual of the sovereign, and in other cases the *cachet* appointed by the act of union for Scotland, attached to it, became the warrant of a conveyance under one or other of the seals, according to the nature of the subject or the object in view. *Imp. Dict.*

5. A letter or figure placed by the printer at the foot of the first page of every section or gathering of a book. The letters begin with A, the figures with 1, and follow in regular order on succeeding sections. They are intended to aid the binder in folding, collating, and arranging the sections consecutively. In early printed books the signature-mark was often repeated on the 3d, 5th, and 7th pages of a section of 16 pages as an additional safeguard for the folder: as, A on 1st page, A i on 3d, A ii on 5th, and A iv on 7th page. This practice has been discontinued except for offsets of 12mos, which have the signature repeated.

Hence—6. A sheet; especially, in bookbinders' use, a sheet after it has been folded and is ready to be gathered.—7. In *musical notation*, the signs placed at the beginning of a staff to indicate the key (tonality) and the rhythm of a piece. The term properly includes the clef (which see), since it determines the form of the key-signature. The key-signature consists of sharps or flats placed upon the degrees corresponding to the black digitals of the keyboard that are to be used; their number and position show also the position of the key-note. The key-signature of a minor key is the same as that of its relative major key. A key-signature made up of sharps is called a *sharp signature*; one made up of flats is called a *flat signature*. The key-signature may be altered in the course of the piece. In this case a heavy bar is inserted, and the sharps or flats that are not to continue in force are nullified by cancels (naturals) prefixed to the new signature. The key-signatures most in use with the common G and F clefs are as follows:

Some slight variations in the above forms occur. (See *key*, *key-signature*, and *circle of keys* (under *circle*)). The rhythmic signature, or time-signature, consists of two numerals, the upper of which indicates the number of principal beats in the measure, and the lower the kind of note chosen to represent one such beat. (See *rhythm*, and *rhythmical signature* (under *rhythmical*)). The key-signature is usually repeated at the beginning of every brace; but the rhythmic signature is given but once.

A seal, especially a private seal, used instead of signing the name, or in addition to it, for verification of papers or the like. The signet in Scotland is a seal by which royal warrants connected with the administration of justice were formerly authenticated. Hence the title of *writers to the signet* or *clerks of the signet*, a class of legal practitioners in Edinburgh who formerly had important privileges, which are now nearly abolished. They act generally as agents or attorneys in conducting causes before the Court of Session. In English administration the signet is one of the seals for the authentication of royal grants, which before the abolition of the signet-office in 1848 was there affixed to documents before passing the privy seal, but it is not now required.

*Silene* (sī-lē'nē), *n.* [NL. (Linnaeus, 1737), so called in allusion to the frequent sticky exudation on its stems; < L. *Silēnus*, Silenus: see *Silēnus*.] A genus of polypetalous plants, of the order Caryophyllaceae, type of the tribe *Sileneae*. It is characterized by flowers usually with a ten-nerved five-toothed club-shaped ovary or inflated calyx, five spreading petals upon erect and slender claws commonly with two small scales, ten stamens, and a stalked ovary with one cell, a free central placenta, and usually three styles, the capsule opening at the top by six or by three short valves to discharge the numerous opaque and roughened seeds. About 480 species have been described, but only about 250 are now thought to be distinct. They are annual or perennial herbs of great variety of habit, tall and erect, tufted or procumbent, or partial climbers, with narrow opposite leaves, and pink, scarlet, white, or variously colored flowers, commonly in cymes or in one-sided spikes disposed in a terminal panicle. They are abundant in Asia north of the tropics, and in southern Europe and northern Africa, and there are about 12 species in South Africa. Besides 6 or 8 introduced species in the Atlantic border, the United States contains about 32 species, chiefly in the Rocky Mountain and Pacific region, about half of which are nearly or quite confined to California. Most of the species are known as *catch-fly*. Many are cultivated for their flowers, especially *S. viscosa* and *S. schafta*, with *S. armeria*, the sweetwilliam or Lobel's catch-fly, native of the south of Europe. *S. pennsylvanica*, a glutinous early-flowering species, is the wild pink of the eastern United States (see cut under *anthophore*). (For *S. virginica*, see *fire-pink*, under *pink*.) Many species with an inflated bladder-like calyx are known in general as *campion*, among which *S. alba*, abundant in sands of eastern Europe and known as *Spanish campion*, is used as an astringent. (For *S. acaulis*, also known in England as *cushion-pink*, see *moss-campion*.) *S. cucubatus* (*S. inflata*), the bladder-campion, is a wide-spread species of Europe, central and northern Asia, now introduced in the Atlantic United States. It is also called *behen* and *spitting-poppay*; also, from the shape of its calyx, in America *cushion*, in England *knopbottle* and *whitebottle*. *S. maritima* of the English coast (perhaps a variety of the last) has been called *witches'-thimble*.

*Sileneae* (sī-lē'nē-ē), *n. pl.* [NL. (A. P. de Candel, 1824), < *Silene* + *-ae*.] A tribe of polypetalous plants of the order Caryophyllaceae. It is characterized by flowers with a united and more or less tubular four- or five-toothed calyx, five petals with spreading border and a slender claw often bearing two scales at its summit, usually ten stamens, two or more styles separate to the base—the ovary, stamens, and petals all commonly elevated on a stalk-like gynophore or continuation of the receptacle. It includes 11 genera, all natives of the Old World except certain species of *Dianthus* and *Silene*. (See also *Saponaria*, *Lychnis*, and *Gypsophila*.) Most of the genera are cultivated for their ornamental flowers, as the pink, catchily, etc., which resemble salver-shaped flowers, as phlox, in form, but are composed of separate petals.

Like starry light,  
Spenser, *F. Q.*, II. xii. 78.

If you find yourself approaching to the silent tomb, Sir, think of me.  
Dickens, *Martin Chuzzlewit*.

**Silent-alarm system.** See *fire-alarm telegraph*, under *fire-alarm*.—**Silent letter**, a letter of a word which is not sounded or pronounced in the enunciation of the word, as the *b* in *doubt*, the *c* in *virtual*, the *d* in *handsome*, the second of the two like consonants in *ebb*, *odd*, *off*, etc. The silent letter may be wholly useless, as in the above examples, or it may serve as an accidental or conventional index of the sound given to some adjacent letter: thus, the *e* in *bate*, *mete*, *bite*, *note*, *mute*, etc., is silent, but it indicates that the preceding vowel is long; the *c* in *indict*, the *g* in *sign*, the *l* in *balin*, etc., serve a similar purpose. Silent letters are traditional, representing sounds that once existed in the word, either in English or in the original tongue (as the *p* and *l* in *psalm*, pronounced in Latin *psalmus*, Greek *ψαλμός*), though often, as in this case, artificially restored after having been omitted (AS. *scalm*, ME. *salm*, *saume*), or have been foisted in to suit some false etymology or erroneous analogy, as the *l* in *could*, the *g* in *foreign*, the *p* in *plarmigan*, etc. The proportion of silent letters in the present English spelling is about 12½ per cent.—**Silent spirit**, distilled spirit which is nearly or quite destitute of flavor and odor. Compare *silence*.—**Silent system**, a system of prison discipline which imposes entire silence among the prisoners, even when assembled together.—**Silent Week**, Holy Week. Also *Still Week*.—**The Silent Sister**, an ironical name of Ireland.—**Syn.** 1 and 2. *Silent*, *Tacturn*, *Dumb*, *Mute*. *Silent* expresses the fact of not speaking, *tacturn* the habitual disposition to refrain from speaking. *Dumb* strictly implies lack of the organs of speech, or defect in them, or lack of the power of speaking, while *mute* implies some special cause; hence *deaf-mute* is thought by many a better name than *deaf-and-dumb person* for one who does not speak on account of deafness; an idol is *dumb*, not *mute*. Under figurative extension *mute*, *dumb*, and *silent* are often used outside of the lines here indicated. In such freer use there is an advance in strength from *silent* to *mute* and from *mute* to *dumb*: as, *silent* from abstraction; *mute* with astonishment; struck *dumb* with horror.

Originally, a portrait in black or some other uniform tint, sometimes varied as to the hair or other parts by lighter lines or a lightening of shade, showing the profile as cast by a candle on a sheet of paper; hence, any opaque portrait, design, or image in profile. Silhouette portraits were very common throughout the early years of the nineteenth century, and are often cut out of black paper.

**silica** (sil'i-kā), n. [*NL.* < *L. silix* (*silic-*), flint: see *silic*.] Silicon dioxid ( $\text{SiO}_2$ ), or silicic anhydride, a white or colorless substance, nearly insoluble in water and in all acids except hydrofluoric acid. Silica is extremely hard, and fuses with difficulty in the oxyhydrogen flame to a colorless amorphous glass. In nature, as quartz, it is universally distributed, and is the commonest of minerals; here belong the varieties rock-crystal, amethyst, chalcedony,

Silhouette of George Washington.

agate, carnelian, onyx, jasper, flint, hornstone, etc., which differ in degree of crystallization and in purity, and hence in color. Silica in the form of quartz makes the sand of the sea-shore, and rock-masses as quartzite and sandstone. It also occurs as the rare mineral tridymite, known only in volcanic rocks and in a few meteorites, and as the amorphous opal, which is softer and more soluble than quartz and contains more or less water. (See *quartz*, *tridymite*, *opal*, also *asmanite*, *cristobalite*, *melanophlogite*.) Silica also forms the material of the spicules of many sponges and of the frustules of diatoms; deposits of the latter are not uncommon under peat-swamps, and in some regions vast beds have been accumulated. (See *infusorial earth*, under *infusorial*.) Silica combines with bases to form compounds called *silicates*, which constitute the rocky crust of the globe. It occurs in solution in the waters of many mineral springs, and sometimes is deposited in enormous quantities about geyser-basins. From the silicates taken up by plants silica is often deposited on the surface or in the interior of their stems. The value of the equisetum, or scouring-rush, is due to the silica contained in it, which sometimes amounts to 18 per cent. of the fresh plant. Sand is extensively used for the manufacture of glass and mortar. The prominent silicates recognized among minerals are the *metasilicates*, salts of metasilicic acid ( $\text{H}_2\text{SiO}_3$ ), and *orthosilicates*, salts of orthosilicic acid ( $\text{H}_4\text{SiO}_4$ ). Examples are rhodonite, or manganese metasilicate ( $\text{MnSiO}_3$ ), and willemite, or zinc orthosilicate ( $\text{Zn}_2\text{SiO}_4$ ). There are also disilicates, polysilicates, etc., but they are rarer, and their nature is less clearly understood. See *glass*, *mortar* 2, and *sand* 1. Also called *silic*.—**Infusorial silica**. Same as *infusorial earth* (which see, under *infusorial*).—**Silica bandage**, in *surg.*, a bandage which is moistened with sodium silicate after having been applied.

**silicate** (sil'i-kāt), n. [*Silic-ic* + *-ate* 1.] A salt of silicic acid. Silicates formed by the union of silicic acid with the bases alumina, lime, magnesia, potassa, soda, etc., constitute by far the greater number of the minerals which compose the crust of the globe. Glass is a mixture of artificial silicates of alkalis and alkaline earths or metallic oxides (see *glass*).—**Silicate cotton**. See *cotton* 1.

**silicated** (sil'i-kā-ted), a. [*Silicate* + *-ed* 2.] Coated, mixed, combined, or impregnated with silica.—**Silicated soap**, a mixture of sodium silicate and hard soap.

**silicization** (sil-i-kā-ti-zā'shon), n. [*Silicate* + *-ize* + *-ation*.] The process of combining with silica so as to change to a silicate. [Rare.]

The acid is a colloid, and is obtained in an aqueous solution, which if concentrated sets to a jelly. Silicic acid has not yet been obtained in the pure form, as it undergoes decomposition into water and silica when dried. There are several hypothetical silicic acids, from which the several classes of silicates are supposed to be formed. Such are orthosilicic acid ( $\text{H}_4\text{SiO}_4$ ), metasilicic acid ( $\text{H}_2\text{SiO}_3$ ), and parasilicic acid ( $\text{H}_6\text{SiO}_5$ ). None of these acids has been isolated.—**Silicic ether**, a compound of silicic acid with an alkyl, as methyl silicate ( $(\text{CH}_3)_4\text{SiO}_4$ ).

Next to oxygen, silicon is the most abundant element in nature. It is found only in combination, chiefly with oxygen, forming silicon dioxide, or silica, which combined with bases makes up the larger part of the rock-crust of the globe. Also called *silicium*.—**Silicon-brass**, brass prepared with the addition of a small amount of silicon, by which its valuable qualities are said to be improved.—**Silicon-bronze**, copper prepared with the addition of a small amount of silicon-copper, by which its valuable properties for certain uses, as for telegraph-wire, are said to be considerably improved. Weiller's silicon-bronze telegraph-wire was found by analysis to consist of almost chemically pure copper, with 0.02 per cent. of silicon. The silicon-bronze telephone-wire of the same maker contained 1.02 per cent. of zinc, 1.14 of tin, and 0.05 of silicon. The addition of the silicon in the manufacture of silicon-bronze seems to have no other effect than that of entirely removing the oxygen of the copper.—**Silicon-iron**, iron containing a large proportion of silicon (as much, in some instances, as 10 to 14 per cent.), prepared for use in improving the quality of cast-iron, especially for foundry use,

Also called *high-silicon iron*, and, of late more generally, *ferro-silicon*. "When the founder understands its [silicon's] use, he may soften and toughen, or harden and strengthen his iron to suit his requirements." (*Keap and Orton*, Trans. Amer. Inst. Min. Eng. The Chinese name for silk is *szé*, *szü*, *sz'*, with variants *sei*, *si*, whence Korean *sa*, *sil*, *sir*, Mongol *sereg*, *silk*, < *se* (< Chinese *szé*, *sei*) + *-reg*, a suffix of Tatar languages. The Chinese word is prob. not connected with the European, except that the Gr. *Σῆρες* may mean the Chinese, and be based on the Chinese name for silk. For the more common Teut. word for 'silk,' see *say*.] 1. n. 1. A fine soft thread produced chiefly by the larvæ of various bombycid moths, especially of *Bombyx* (*Sericaria*) *mori*, known as *silkworms*, feeding on the leaves of the mulberry and several other trees. (See *Bombyx* and *silkworm*, and compare *gut*, 4.) Silk is the strongest, most lustrous, and most valuable of textile fibers. The thread is composed of several finer threads drawn by the worm from two large organs or glands containing a viscid substance, which extend, as in other cocoon-making caterpillars, along a great part of the body and terminate in two spinnerets at the mouth. With this substance the silkworm envelops itself, forming its cocoon. *Raw silk* is produced by the operation of winding off at the same time several of these cocoons, after they have been immersed in hot water to soften the natural gum on the filament, on a common reel, thereby forming one smooth, even thread. Before it is fit for weaving it is converted into one of three forms, namely *singles*, *tram*, or *organzine*. *Singles* (a collective noun) is formed of one of the reeled threads, twisted in order to give it strength and firmness. *Tram* is formed of two or more threads twisted together, and is commonly used in weaving as the *shoot* or *weft*. (For *organzine*, see *thrown silk*, below.) Silk of various qualities (but none fully equal to the preceding) is produced by different genera of the family *Saturniidae*, particularly the tusser-worm of India, *Attacus mytila*, the yama-mai of Japan, *Antheraea yama-mai*, etc., feeding on the oak and other plants. 2. A similar thread or fiber spun by various other insects, especially some spiders; a kind of cobweb or gossamer. Some such webs are lustrous, and may be reeled like true silk. See *Nephila*, and cut under *silk-spider*.—3. Cloth made of silk; by extension, a garment made of such cloth. In this sense the word has a plural, *silks*, denoting different sorts or varieties: as, *black silk*; *white silk*; *colored silks*.

Thus, the characteristics of prototypembryos, derived from the adults of a common more or less remote stock of the same division of the animal kingdom, are matters of *silphology*. *Huall*.

**silt** (silt), *n.* [ME. *silte*, erroneously *cilte*; with formative *-t*, < *silen*, drain, filter, strain: see *sile*.] A deposit of mud or fine soil from running or standing water; fine earthy sediment: as, a harbor choked up with *silt*.

See cut under *Siluridae*.

**Silurian** (si-lū'ri-an), *a.* and *n.* [*< L. Silures* (Gr. Σίλτες), the Silures (see def. 1), + *-ian*.] I. *a.* 1. Of or belonging to the Silures, a people of ancient Britain, or their country.—2. In *geol.*, of or pertaining to the Silurian. See II.

II. *n.* A name given by Murchison, in 1835, to a series of rocks the order of succession of which was first worked out by him in that part of England and Wales which was formerly inhabited by the Silures. The various groups of fossiliferous rocks included in the Silurian had, previous to Murchison's labors, been classed together as one assemblage, and called by the Germans *grauwacke*, sometimes Anglicized into *grauwacke* (which see), also the *Transition series* or *Transition limestone*. In England and Germany these lower rocks have been greatly disturbed and metamorphosed, and have also been frequently invaded by eruptive masses; hence it was not until after considerable progress had been made toward a knowledge of the sequence of the higher fossiliferous groups that the lower (now designated as *Silurian* and *Devonian*) began to be studied with success. Almost contemporaneously with the working out of the order of succession of these lower rocks by Murchison in Great Britain, groups of strata of the same geological age, but lying for the most part in almost entirely undisturbed position, began to be investigated on and near the Atlantic coast of the United States, especially in New York, by the Geological Survey of that State, and a little later in Bohemia by Joachim Barrande. Murchison, Barrande, and James Hall, paleontologist of the New York Survey, are all agreed as to the adoption of the name *Silurian*, and in regard to the essential unity of the series or system thus designated. The Silurian is the lowest of the four great subdivisions of the Paleozoic, namely

Silurian, Devonian, Carboniferous, and Permian. When undisturbed and unmetamorphosed, the Silurian is usually found to be replete with the remains of organic forms, of which by far the larger part is marine. The Silurian is divided into an Upper and a Lower Silurian, and each of these again is subdivided into groups and subgroups varying in nomenclature in various countries. The line between the Upper and Lower Silurian is drawn in Great Britain at the top of the May Hill sandstone or Upper Llandovery group; in New York, at the top of the Hudson River or Cincinnati group. The almost entire absence of vertebrates and of land-plants, and the paucity of plant-life in general, are the most striking features of Silurian life. The most prominent forms of the animal kingdom were the graptolites, trilobites, and brachiopods, and of these the first-mentioned are the most characteristic of all, since they range through nearly the whole Silurian, and disappear in the Devonian; while the trilobites, which begin at the same time with the graptolites, continue through the Devonian, and end only with the Carboniferous. As the line between the Silurian and Devonian is commonly drawn in England—namely, so as to include in the former the Ludlow group—the first vertebrates, in the form of a low type of fishes, appear near the top of the Upper Silurian; traces of land-animals (scorpions) have also been found in the Upper Silurian of Sweden and Scotland; and in France, in the Lower (?) Silurian, traces of insect life. A scorpion has also been found in the United States, at Waterville, New York, in the Waterline group, or near the middle of the Upper Silurian. Mr. Whitfield, by whom the specimen was described, inclines to the opinion that the species, for which he instituted a new genus (*Proscorpius*), was aquatic and not air-breathing, and that it forms a link between the true aquatic forms like *Eurypterus* and *Pterygotus* and the true air-breathing scorpions of subsequent periods. He intimates that the same is likely to be true of the Swedish and Scottish Silurian scorpions. The traces of land-plants in the Silurian are rare, and for the most part of doubtful identification. Algae, on the other hand, are of somewhat frequent occurrence. As the line between Silurian and Devonian is drawn in the United States—namely, between the Oriskany sandstone and the Canda-gall grit—there are neither land-animals nor fishes in the Silurian; and the evidence of the existence of land-plants lower than the Devonian is for the most part of a very doubtful character. The Silurian rocks are widely spread over the globe, with everywhere essentially the same types of animal life. This part of the series is of importance in the United States, especially in the northeastern Atlantic States and in parts of the Mississippi valley.

**Siluric** (si-lū'rik), *a.* [*< L. Silures* (see *Silurian*) + *-ic*.] Same as *Silurian*. [Rare.]

**silurid** (si-lū'rid), *a.* and *n.* Same as *siluroid*.

**Siluridae** (si-lū'ri-dē), *n. pl.* [NL., < *Silurus* + *-idae*.] A very large family of physostomous fishes, of the order *Nematognathi*, represented by such forms as the sheat-fish of Europe and the catfishes or eels of America. It was the same as *Siluridae* of Cuvier. By Cope its name was used for *Nematognathi* with the anterior vertebrae regularly modified, the inferior pharyngeal bones separate, and an operculum developed. It thus contrasted with the *Apredinidae* and *Hypophthalmidae*, and included all the *Nematognathi* except those belonging to the two families named. By Gill the family was restricted to those *Nematognathi* which have the anterior vertebrae regularly modified; the lower pharyngeal bones separate; the operculum developed; a dorsal fin, in connection with the abdominal portion of the vertebral column, rather short, and preceded by the spine; the pectoral fins armed with well-developed spines having a complex articulation with the shoulder-girdle; and the body naked, or with plates only along the lateral line. The lower jaw has no reflected lip, and there are usually from four to eight pairs of barbels, maxillary barbels being always developed. Species of the family thus limited are very numerous, several hundred having been described, and referred to many genera. Most of them inhabit fresh water, especially of tropical and subtropical countries, but many are also found in tropical seas. In Europe, one, the sheat-fish, *Silurus glanis*, oc-

curs in the central and eastern regions of the continent; while a second, more southerly, and supposed to be the giant of the ancients, has lately (1890) been distinguished as *Silurus (Parasilurus) aristotelis*. In North America the family is represented by a number of species belonging to different subfamilies, which are generally known under the name of *catfishes*. The leading genera of North America are *Naturus*, stone-cats; *Ambloplites*, ordinary eels, pouts, bullheads, etc.; *Ictalurus*, channel-cats; *Arius*, sea-cats; and *Atherichthys* (or *Felichthys*), gulf-topalls. See also cuts under *catfish*, *gulf-topall*, *pout*, and *stone-cat*.

A Linnean genus of fishes, typical of the family *Siluridae*, formerly corresponding to that family, now restricted to the European sheat-fish, *S. glanis*, and a few closely related species of Asia. See cut under *Siluridae*.—2. [*l. c.*] A fish of this genus: as, the sly *silurus*.

**silva, silvan**, etc. See *sylva*, etc.

**Silvanus** (sil-vā-nus), *n.* [*L.*, < *silva*, a wood, a forest: see *sylva*.] 1. A Roman rural deity.

He is usually represented with a sickle in his right hand and a bough in his left, and is described as the protector of herds from wolves and of trees from lightning, and a patron of agriculture in general, and as the defender of boundaries.

2. [NL. (Latreille, 1807).] A genus of clavicorn beetles, of the family *Cucujidae*, consisting of small, slender species with five-jointed tarsi in both sexes, the fourth joint very small, and antennal joints from nine to eleven, abruptly enlarged. They live under the bark of trees or in stored food-products. *S. surinamensis* is found all over the world, feeding on many kinds of drugs, all stored farinaceous products, etc.

Some attempt to connect *silver* with *L. sulfur*, sulphur (see *sulphur*), others with Gr. *αἰδρός*, iron.] I. *n.* 1. Chemical symbol, Ag; atomic weight, 107.93. A metal of a white color, having a specific gravity of 10.4 to 10.7 (according as it is cast, rolled, or hammered), harder than gold, and softer than copper, having a tenacity about equal to that of gold, and melting at a temperature a little lower than copper. Its whiteness is remarkable, that of tin alone among the common metals nearly approaching it; among the rare metals, iridium and lithium are equal to silver in color and luster. Silver crystallizes in the regular (isometric) system; but, although native silver is of frequent occurrence, distinct crystals are very rare. Arborescent and fibrous shapes are most common, but very large solid masses have been found. Silver occurs in a great variety of ores, being mineralized by sulphur, antimony, and arsenic, as well as by chlorine, iodine, and bromine. These ores are widely distributed over the world. Silver is very commonly associated with lead; and the common ore of the latter metal, galena, always contains some silver, and generally enough to make its separation remunerative. Silver has also been detected in the water of the ocean. The principal silver-producing regions are the Andes and Cordilleras. From Peru and Bolivia came an immense supply of this metal during the sixteenth and seventeenth centuries. Mexico has been a large producer of silver since the middle of the sixteenth century. The mines of the Comstock lode at Virginia City, in Nevada, produced about \$320,000,000 worth of bullion from 1860 to 1890, about five twelfths of the value of which was silver. This metal has always been accounted "precious," and has been used for ornament and as a measure of value from the earliest times of which there is any historical record. Its most marked point of inferiority to gold, apart from color, is its liability to tarnish when exposed to sulphurous emanations or brought into contact with anything containing sulphur. Silver is too soft to be used in the unalloyed condition. The ratio of silver to copper in the silver coinage of England is 92½ to 7½ (or 12½ to 1); in that of France and the United States, 9 to 1; and in that of Prussia, 3 to 1. The world's production of silver, estimated in dollars (at the ruling rate of \$1.2929 per ounce), has increased from \$80,000,000 in 1870 to \$210,000,000 in 1891. In the United States the production increased from \$41,000,000 in 1870 to \$82,000,000 in 1892. In 1893 it was \$77,000,000, in 1894 \$64,000,000, in 1895 about \$60,000,000, and in 1896 about \$70,000,000. From the foundation of the government until 1873, when the free coinage of

silver was stopped (see *coinage ratio*, *dollar*), about \$8,000,000 were coined. Under the silver-purchase acts of 1878 and 1890 over \$300,000,000 have been coined, but only about \$80,000,000 are in circulation. (See *silver certificate*, below.) The total amount of silver purchased by the government from Feb. 12, 1873, to Nov. 1, 1893 (when the purchase act of 1890 was repealed), was 490,984,889 ounces, at a cost of \$508,939,976. Political agitation for the resumption of the free coinage of silver at the existing ratio (about 16 to 1) has been carried on vigorously in the West and South since about 1878; and in 1890 the Democratic party made this the chief plank in its platform, and was defeated on this issue.

The relative proportions of the metals in the alloy called German silver vary considerably, according to the desire of the manufacturer to produce a cheaper or more expensive article. The commonest kind contains about eight parts of copper, two of nickel, and three to five of zinc. A finer kind of alloy is obtained by adding more nickel; the metal is then less liable to tarnish, and the resemblance to silver in color and luster is more striking. Nickel is a much more expensive metal than copper, and very much more so than zinc. See *nickel*.—**King's silver.** (a) A name given to silver used in England from about 1700 to 1720 for plate of an unusually high standard: apparently introduced by workmen from the continent, and abandoned because not sufficiently hard and durable. Compare *sterling*. (b) In old Eng. law, a payment made to the king for liberty to abandon or compromise the judicial proceeding for the conveyance of property called a *fine*. It is a native of the mountains of central and southern Europe, planted elsewhere. It grows from 80 to 120 or even 200 feet high. Its timber is soft, tough, and elastic, of a creamy-white color, useful for many building and cabinet purposes, for making the sounding-boards of musical

instruments, toys, etc. It yields resin, tar, and the Strasburg turpentine. This is the "noble fir" (*edler Tannenbaum*) of the Germans. The silver fir of the Alleghany region, etc., is *A. balsamea*, mostly called *balsam* or *balm-of-Gilead fir*. It is a moderate-sized tree, its twigs sought for scented cushions, its bark secreting Canada balsam (see *balsam*), also the source of spruce-gum. Pacific North America presents several noble silver firs, as *A. grandis*, the white fir of Oregon bottom-lands, and *A. nobilis* and *A. magnifica*, the red firs of the mountains of Oregon and California, all trees between 200 and 300 feet in height.—**Silver fox,** the common red fox, *Vulpes fulvus*, in a melanistic variation, in which the pelage is black or blackish, overlaid with hoary or silver-gray ends of the longer hairs. It is an extreme case of the range of variation from the normal color, of which the cross-fox is one stage. It occurs in the red foxes of both America and Europe, especially in high latitudes, and constitutes the *Cans* or *Vulpes argentatus* or *argenteus* of various authors. The silver fox has sometimes been defined wrongly as a variety of the gray fox of the United States (*Urocyon cinereo-argentatus*), perhaps by some misapprehension of Schreber's (1778) specific name, just cited; but this is a distinct species of a different genus, and one in which the silver-black variation is not known to occur. Compare cut under *cross-fox*.

While the Cross and Black and Silver Foxes are usually considered as different varieties, they are not such in the classificatory sense of that term, any more than are the red, black, or white wolves, the black marmots, squirrels, etc. The proof of this is in the fact that one or both of the "varieties" occur in the same litter of whelps from normally colored parents. They have no special distribution, although, on the whole, both kinds are rather northerly than otherwise, the Silver Fox especially so. Coues and Yarrow, Wheeler's Expl. West of the 100th Meridian, V. 53.

They are deep-sea forms parasitic upon other fishes. The form is shorter and more robust than in the common eels, but the scales are distributed in the same manner. The head ends in a short and blunt snout, and the lower jaw is deep and strong. The teeth are blunt, incisor-like, and in one row on the edge of the jaws. Only one species is known, *S. parasiticus*, which is found in deep water, and is prone to attack fishes that have been hooked, especially the halibut, into whose flesh it burrows. It is very abundant on the banks south of Newfoundland. **Simenchelys** (si-meng'ke-lis), *n.* [NL., < Gr. *simē*, snub-nosed, flat-nosed, + *ēkhēlos*, *ēkhēlos*, an eel.] The representative genus of *Simenchelyidae*, having scales like those of the com-

The form is more nearly human than that of any other animal below man. The carriage is semi-erect, or capable of becoming so; the arms are much longer than the legs; the tail is rudimentary (in the gorilla with fewer vertebrae than in man); the sacrum is large and solid; the sternum is short and broad, with three or four intermediate sternbrae; and the spinal column has a slight sigmoid curve, giving a "small of the back" somewhat as in man; the teeth are thirty-two, with the same formula as in man; and the nose is catarrhine, as in the rest of the Old World apes. Having characteristics in common; like in form, appearance, size, qualities, relations, etc.; having a more or less marked resemblance to each other or one another; in some respects identical; bearing a resemblance, as to something implied or specified: as, the general features of the two landscapes are *similar*; the plans are *similar*.

*Boyle*, Works, I. 206.

3. [Tr. Gr. *śuotos*.] In *geom.*, of the same shape: said of two figures which have all their corresponding angles equal, whence it will follow, for ordinary Euclidean space, that all their corresponding lengths will be proportional, that their corresponding areas will be in the duplicate ratio of their lengths, and that their corresponding volumes will be in the triplicate ratio of their lengths. In the non-Euclidean systems of geometry these consequences are falsified, so that there are no similar figures.

*Similar* solid figures are such as have their solid angles equal, each to each, and are contained by the same number of *similar* planes. *Euclid's Elements*, Bk. xi. def. xi.

4. In *biol.*, alike in some respects; identical to some extent. Specifically—(a) Having the like structure; of common origin; homologous (which see). (b) Having the like function or use, though of unlike origin; analogous (which see). These two senses are respectively the morphological and the physiological application of the word to parts or organs of animals and plants.

The law of *similars*. (a) The law of mental association by which similar ideas are connected in the mind and suggest one another. This kind of association is denied by some psychologists, who forget that without it *similarity* would have no possible meaning. When we say that today's idea is like yesterday's, we can only mean that a sense of affinity connects them. The kind of association is the essential condition of generalization. (b) The homeopathic principle of administering drugs. See *similia*.

In Argument

*Similies* are like Songs in Love:

They much describe; they nothing prove.

*Prior*, *Alma*, iii.

=**Syn.** *Simile*, *Metaphor*, *Comparison*, *Allegory*, *Parable*, *Fable*, *similitude*, *trope*. The first six words agree in implying or expressing likeness between a main person or thing and a subordinate one. *Simile* is a statement of the likeness in literal terms: as, man is like grass; Herod is like a fox. *Metaphor* taxes the imagination by saying that the first object is the second, or by speaking as though it were: as, "All flesh is grass," Isa. xl. 6; "Go ye and tell that fox," Luke xiii. 32. There are various combinations of *simile* and *metaphor*: as, "We all do fade as a leaf," Isa. lxxv. 6.

"There are a sort of men whose visages

Do cream and mantle like a standing pool"

(*Shak.*, M. of V., i. 1. 89).

In these the *metaphor* precedes; in the following the *simile* is in the middle of the *metaphor*: "These metaphysic rights, entering into common life, like rays of light which pierce into a dense medium, are, by the laws of Nature, refracted from their straight line." (*Burke*, *Rev.*, in France.) In the same way the *simile* may come first. A *comparison* differs from a *simile* essentially in that the former fixes attention upon the subordinate object, while a *simile* fixes it upon the main one: thus, one verse of Shelley's "Ode to the Skylark" begins by saying that the skylark is like a poet, whose circumstances are thereupon detailed. Generally, on this account, the *comparison* is longer than the *simile*. The *allegory* personifies abstract things, usually at some length. A short *allegory* is Ps. lxxx. 8–16. Spenser's "Faery Queene" is a series of *allegories* upon the virtues, and Bunyan's "Pilgrim's Progress" allegorizes Christian experiences. These are acknowledged to be the most perfect *allegories* in literature. The *allegory* is an extended *simile*, with the first object in the *simile* carefully left unmentioned. A *parable* is a story that is or might be true, and is used generally to teach some moral or religious truth: as, the three *parables* of God's great love for the sinner in Luke xv. Socrates' story of the sailors who chose their steersman by lot, as suggesting the folly of a similar course in choosing the helmsman of the state, is a fine example of the *parable* of civil life. A *fable* differs from a *parable* in being improbable or impossible as fact, as in making trees choose a king, beasts talk, or frogs pray to Jupiter; it generally is short, and points a homely moral. See the definitions of *apologue* and *trope*.

**simile** (sim'i-lē), *adv.* [It., < L. *simile*, *similis*, like: see *similar*, *simile*, *n.*] In *music*, in the same manner; similarly. Compare *scempre*.

**similia** (si-mil'i-i), *n. pl.* [NL. neut. pl. of L. *similis*, like: see *similar*.] Things which are similar or alike; like things; similars.—**Similia similibus curantur**, or 'like cures like,' 'like things are cured by like things,' the homeopathic formula, meaning that medicines cure those diseases whose symptoms are like the effects of the medicines on the healthy organism. Thus, belladonna dilates the pupil of the eye; it is therefore remedial of diseases of which dilatation of the pupil is pathognomonic.

**similiter** (si-mil'i-tēr), *adv.* [L., < *similis*, like, resembling.] In like manner: in *law*, the technical designation of the common-law form by which, when the pleading of one party, tendering an issue, demanded trial, the other accepted the issue by saying, "and the [defendant] doth eth the like."

**similitude** (si-mil'i-tūd), *n.* [*ME.* *similitude*, < *OF.* (and F.) *similitude* = Sp. *similitud* = It. *similitudine*, < L. *similitudo* (-*din*-), likeness, < *similis*, like: see *similar*. Dan. *synd* (not in Goth.), *sin*, akin to *L. son*(*t*-), *sinful*, *guilty*, *soniticus*, dangerous, hurtful, and perhaps to Gr. *árrn*, *sin*, mischief, harm. According to Curtius and others, the word is an abstract noun formed from the ppr. represented by *L. \*sen*(*t*-), *en*(*t*-), being, and by AS. *sōth*, true, sooth, = Icel. *sanur*, etc., lit. 'being (so)' (see *sooth*), Goth. *sunja*, the truth, sooth.] 1. Any want of conformity unto or transgression of the law of God. (*Westminster Assembly's Shorter Catechism*.) The true definition of sin is a much contested question, theologians being broadly divided into two schools of thought, the one holding that all sin consists in the voluntary and conscious act of the individual, the other that it also includes the moral character and disposition of the race; one that all moral responsibility is individual, the other that there is also a moral responsibility of the race as a race. To these should be added a third school, which regards sin as simply an imperfection and immaturity, and therefore requiring for remedy principally a healthful development under favorable conditions. Theologians also divide sin into two classes, *actual sin* and *original sin*. Actual sin consists in the voluntary conscious act of the individual. (See *actual*.) Original sin is the innate depravity and corruption of the nature common to all mankind. But whether this native depravity is properly called *sin*, or whether it is only a tendency to sin and becomes sin only when it is yielded to by the conscious voluntary act of the individual, is a question upon which theologians differ. Roman Catholic and other theologians, following the early church fathers, distinguish between *mortal* (or *deadly*) and *venial* sins. Mortal or deadly sins are such as wilfully violate the divine law, destroy the friendship of God, and cause the death of the soul. The seven mortal or deadly sins are pride, covetousness, lust, anger, gluttony, envy, and sloth. Venial sins are such transgressions as are due to inadvertence, do not destroy the friendship of God, and, while tending to become mortal, are not in themselves the death of the soul. The difference is one of degree, not of kind.

And ye knowe also that it was do be me, and so sholde myn be the *synne*.

Martin (E. E. T. S.), i. 80.

Sure, it is no *sin*;

Or of the deadly seven it is the least.

= *SYN. 3.* Because, *Since*, *As*, *Inasmuch* as, *For*. Because (originally by cause) is strong and the most direct. *Since*, starting from the idea of mere sequence in time, is naturally less emphatic as to causation: its clause more often precedes the main proposition. *As* is still weaker, and, like *since*, generally brings in the reason before the main proposition: *as* or *since* the mountain will not come to Mohammed, Mohammed must go to the mountain. *Inasmuch* as is the most formal and emphatic, being used only to mark

the express reason or condition. *For* follows the main proposition, and generally introduces that which is really continuative of the main proposition and of equal or nearly equal importance, the idea of giving a reason being subordinate.

Sylvester, tr. of Du Bartas's Weeks, i. 3.

2. In *trigon.*, formerly, with reference to any arc of a circle, the line drawn from one extremity of the arc at right angles to the diameter which passes through its other extremity; now ordinarily, with reference not to the arc but to the angle which it subtends at the center of the circle, the ratio of the aforesaid line to the radius of the circle. Thus, in the diagram, BE is the sine of the arc AB (sometimes it is defined as half the chord of double the arc), and the ratio of BE to CB is the sine of the angle ACB. (See *trigonometrical functions*, under *trigonometrical*.) A more scientific definition of

the sine is that of Euler,  $\sin x = \frac{1}{2}i(e^{-xi} - e^{xi})$ , where  $i^2 = -1$ , and  $e$  is the Napierian base. The sine is also fully defined by the infinite series

$$\sin x = x - \frac{x^3}{3!} + \frac{x^5}{5!} - \dots$$

But all the properties of sines are readily deduced from the definition that the sine is such a function that it vanishes with the variable, while

$$\frac{d \sin x}{dx} = \sqrt{1 - (\sin x)^2}.$$

Abbreviated *sin*, as in formulae here given.—**Arithmetic of sines**, analytical trigonometry. Its object is to exhibit the relation of the sines, cosines, tangents, etc., of arcs, multiple arcs, etc.—**Artificial sine**. See *curve*.—**Lines of sines**, a scale having divisions marked with values of an angle in arithmetical progression, the distances of the divisions from the origin being proportional to the sines of these angular values.—**Logarithmic sine**, the logarithm of a natural sine.—**Natural sine**, the sine as above defined: the expression arose when *sine* was still understood as a half-chord, and meant the sine for radius unity (or some multiple of ten).—**Sine galvanometer**. See *galvanometer*.—**Sine of the (m-1)th order**, the function expressed by the series

$$\frac{x^{m-1}}{(m-1)!} + \frac{x^{2m-1}}{(2m-1)!} + \frac{x^{3m-1}}{(3m-1)!} \pm \dots$$

These functions were invented by Wronski.—**Sine of three lines which meet in a point**, the sine of the angle between the first line and the plane of the other two, multiplied by the sine of the angle between the other two lines.—**Sine of three planes**, the sine of the angle between the first plane and the intersection of the other two, multiplied by the sine of the angle between the other two planes.—**Subversed sine**. Same as *supplemental versed sine*.—**Supplemental versed sine**, the difference between the versed sine and the diameter.—**Versed sine**, unity minus the cosine. Formerly, for the arc AB (see the diagram), it was understood to be the line EA; now the ratio of EA to BC is the versed sine of the angle ACB.—**Whole sine of a circle**, the radius.

3. In *math.*, an exceptional element or character of a continuum. (a) In *geom.*, a projective character of a locus consisting in certain points, lines, or planes being exceptional in their relations to it. (For examples, see *binode*.) An ordinary singularity is one of a set of singularities of which all others are modifications or components. Thus, an inflectional node upon a skew curve is a modification of an apparent node, and ought not to be reckoned as an ordinary singularity. But cusps and inflections, as stationary points and tangents, are ordinary singularities. A higher singularity is one which differs indefinitely little from an aggregation of ordinary singularities. (See *catenoid*.) By an ellipsis common in geometrical language, the word *singularity* is used for point singularity, or a relation to some exceptional point. Thus, a plane curve with neither nodes nor cusps is said to be without singularities, although, unless a cusp, it has inflections, and unless a cusp or cubic, double tangents. The word *singularity* is also used to denote the number of singular points, lines, or planes of any one kind; also for any number characteristic of a projective property, in which sense the order, class, and rank of a locus are sometimes termed *singularities*. (b) In the theory of functions, a property of a function consisting in it or its differential coefficient becoming discontinuous for a certain value or connected system of values of the variable. — *Elliptic, essential, hyperbolic singularity*. See the adjectives. — *Simple singularity*, a singularity of a function consisting in it or its differential coefficient becoming ambiguous or discontinuous at an isolated point or points, while remaining unambiguous and continuous at all other points infinitely near to these. — *Syn. 1.* Uncommonness, oddness. — 2. Siphons.

pipe or tube with legs of unequal length, used for drawing liquid out of a vessel by causing it to rise in the tube over the rim or top. For this purpose the shorter leg is inserted in the liquid, and the air is exhausted by being drawn through the longer leg. The liquid then rises by the pressure of the atmosphere and fills the tube, and the flow begins from the lower end. Sometimes an exhausting-tube (a in the figure) is placed on the longer leg; the air, in that case, is sucked out through a till the tube is filled to the cock b, which is then opened, and the flow commences—the cock b being so constructed as to close the suction-tube when the siphon is running. But the more general method is to fill the tube in the first place with the liquid, and then, stopping the mouth of the longer leg, to insert the shorter leg in the vessel; upon removal of the stop, the liquid will immediately begin to run. The flow depends upon the difference in vertical height of the two columns of the liquid, measured respectively from the bend of the tube to the level of the water in the vessel and to the open end of the tube. The flow ceases as soon as, by the lowering of the level in the vessel, these columns become of equal height, or when this level descends to the end of the shorter leg. The atmospheric pressure is essential to support the column of liquid from the vessel up to the top of the bend of the tube, and this height is consequently limited, varying inversely with the density of the liquid. At sea-level the maximum height is a little less than 30 inches for mercury and 34 feet for water.

2. In *zool.*, a canal or conduit, without reference to size, shape, or function; generally, a tube or tubular organ through which water or other fluid passes; a siphuncle. In *Teredo* the united siphons are so long that the mollusk resembles a worm. See cuts under *shipworm*, *Teredo*, *quahog*, and *Myal*. (2) A similar siphon in some gastropods, extending from the anterior portion of the mantle over the head. See cut under *Siphonostoma*, 2. The medusiform or sexual persons are usually only in the form of sporozooids, but sometimes are matured before they are set free from the colony. The structure is essentially a hollow stem or stock, budding into many different kinds of appendages, representing modified hydranths, hydriform persons, or undeveloped medusiforms. The appendages which a siphonophoran may or does have are the float, pneumatophore or pneumatocyst, which may be absent or replaced by an inflation of the whole stem, the somatocyst, as in the Portuguese man-of-war; the swimming-bell or nectocyst; the hydrophyllum, covering some of the other parts; the dactylozooids, or tentaculiform person; the gastrozooids or nutritive person, which may be highly differentiated into oral, pharyngeal, gastric, and basal parts, which latter may bear long tentacles; and the sexual persons, medusiform buds proper, or gonophores. The arrangement of these elements is very diverse in the different forms of the order. (b) Formerly, a title of a bachelor of arts; hence, a title  
given to a clergyman; also, a clergyman.

*Sir*. A title formerly applied to priests and curates in  
general, for this reason: dominus, the academical title of  
a bachelor of arts, was usually rendered by *sir* in English  
at the universities. So that a bachelor, who in the books  
stood Dominus Brown, was in conversation called *Sir*  
Brown. . . . Therefore, as most clerical persons had taken  
that first degree, it became usual to style them *Sir*.

with holes equidistantly arranged in a circle, which can be revolved over a jet of compressed

air or steam so as to produce periodic puffs. When the revolutions are rapid enough, the puffs coalesce into a musical tone. The revolution of the disk is effected either by a motor of some kind, or by setting the holes at an oblique angle so that the impact of the jet shall do the work. In the more complicated forms of the instrument two or more tones can be produced at once, either by having two or more concentric circles of holes in the same disk, or by two separate disks: the latter form is called a *double siren*. The number of revolutions required to produce a given tone can be counted and exhibited in various ways; and the application of the instrument in acoustical experiments and demonstrations is wide. In the cut *a* is a perforated disk made to revolve by the pressure of the air forced from the bellows beneath through *d*; *b*, vertical shaft revolving with the disk, and, by means of a pair of cog-wheels in the box *c*, turning the two index-hands on their respective dial-plates, and thus registering the number of revolutions made during the time of observation. Very large sirens are sometimes made for use as fog-signals, the sound being conveyed seaward in a large trumpet-shaped tube called a *fog-horn*, a name also given to the whole arrangement. See *fog-horn*. Also *siren*.

American Manatee (*Manatus americanus*), one of the *Sirenia*.

The brain is small and particularly narrow. The periotic and tympanic bones are ankylosed together, but not with the squamosal; the foramen magnum is posterior, directed somewhat downward; the lower jaw has a well-developed ascending ramus, a coronoid process, and an ordinary transverse condyle; and the teeth are molariform, adapted to chew herbage. The neck is moderate, and the axis has an odontoid process. The fore limbs are moderately developed, with a flexure at the elbow; the carpal, metacarpal, and phalangeal bones are directly articulated and of normal number. There are two mammae, pectoral. The heart is deeply fissured between the ventricles. (See first cut under *heart*.) In nearly all the above characters the *Sirenia* are contrasted with the *Cetacea*, which they resemble, and with which they were formerly classed as *Cetacea herbivora*. They are large or huge univulvate and ungainly aquatic animals, inhabiting the sea-shores, bays, and estuaries of various countries, never going out to sea like cetaceans, nor ascending rivers far. They feed entirely on aquatic vegetation. There are only two living genera, *Manatus* and *Halicore*, the manatees and dugongs, representing two families, *Manatidae* and *Halicoridae*. The sea-cow, *Rhytina stelleri*, recently extinct, represents a third family, *Rhytinae*. There are several other extinct genera, some of them constituting the family *Halitheriidae*. The sirgag inhabits the southeastern Himalayan region, and thence through Burma to Tenasserim, and has occasioned much literature. It was originally described and figured by French ornithologists as a rucker, whence its earliest technical name, *Coracias chinensis* of Boddaert (1783), with the English synonym *Chinese roller* of Latham. These terms being overlooked, the bird was renamed *Corvus sinensis* by Shaw, and the genus *Cissa* (later spelled *Kitta*) was founded upon it by Bole in 1826, since which time it has mostly been called *Cissa sinensis*, sometimes *C. speciosa*.

Sirgag (*Cissa sinensis*).

*ana*. It is 15½ inches long, the wing 6, the tail 7 to 8½; the head is fully crested; the bill and feet are coral-red. The fresh-molted plumage in life is a lovely green, but has the peculiarity of soon changing to verdigris-blue, as it does also in stuffed specimens, particularly if exposed to the light. This green or blue is varied with a black fillet encircling the head, with white tips and black subterminal bars on the tail-feathers and inner quill-feathers, and with bright sanguine red on the wings, which easily fades to a dull reddish-brown. A variety of the sirgag found in Sumatra is called *C. minor*; other species of the same genus are the Ceylonese *C. ornata* and the Japanese *C. thalassina*.

2. Sisters collectively, or a society of sisters; in religious usage, an association of women who are bound by monastic vows or are otherwise devoted to religious work as a vocation. In the Roman Catholic Church the members of a sisterhood may be bound by the irrevocable vows of poverty, chastity, and obedience, and are then called *nuns*, or may be merely under one rule and bound by revocable vows. In the Church of England and its offshoots there are also sisterhoods, the members of which either take a revocable vow of obedience to the rule of their association, or live under the rule of the order without vow. Among the more important of the sisterhoods are the Sisters of Charity (see *charity*), the School Sisters of Notre Dame, the Little Sisters of the Poor, the Sisters of the Assumption, the Congregation of Sisters of Notre Dame, the Anglican Sisterhoods of St. John the Baptist, of the Holy Communion, of St. Mary, etc. The Sisters of Mercy is an order founded in 1857 in Dublin, with purposes analogous to those of the Sisters of Charity. The vows are for life. A similar sisterhood in the Church of England was founded about 1845 for assisting the poor. It consists of three orders—those who live in community actively engaged in assisting the poor, those who live in community but are engaged in devotions and other secluded occupations, and those not living in the community but assisting it as co-workers. There are also a number of somewhat similar organizations in the Episcopal Church in the United States.

**Sisymbria** (sis-im-brī'ē-ē), *n. pl.* [*NL. (Endlicher, 1836), < Sisymbrium + -ia.*] A tribe of polypetalous plants, of the order *Cruciferae*. It is characterized by a narrow elongated pod or silique, with the seeds commonly in one row, and the seed-leaves incumbent and straight or in a few genera convolute or transversely plicate. It includes 21 genera, of which *Sisymbrium* is the type, chiefly plants of temperate regions. See *Sisymbrium*, *Heperis*, and *Erysimum*.

**Sisymbrium** (si-sim'brī-um), *n.* [*NL. (Tournefort, 1700), < Gr. σισυμβριον, a name applied to certain odoriferous plants, one said to be a crucifer, another Mentha aquatica.*] A genus of cruciferous plants, type of the tribe *Sisymbrieae*. It is characterized by annual or biennial smooth or hairy stems; flowers with free and unappended stamens, and a roundish and obtuse or slightly two-lobed stigma; and linear sessile pods, usually with three-nerved valves and many oblong seeds with straight cotyledons. It is destitute of the two-parted bristles found in the related genus *Erysimum*, which also differs in its linear or oblong leaves. Besides a great number of doubtful species, about 60 are recognized as distinct. They are natives especially of central and southern Europe, Siberia, and western Asia as far as India; a few are found in temperate and subarctic North America, and a very few in the southern hemisphere. They bear a stellate cluster of radical leaves, and numerous alternate stem-leaves which are usually clasping and irregularly lobed or pinnately divided. The flowers are usually borne in a loose bractless raceme, and are commonly yellow. The various species simulate the habit of many widely different genera. A few, constituting the subgenus *Arabidopsis* (A. P. de Candolle, 1821), have white, pink, or purplish flowers; two others, by some separated as a genus *Alliaria* (Adanson, 1763), have also broad or triangular heart-shaped undivided leaves, as *S. Alliaria*, the hedge garlic. For *S. officinale*, see *hedge-mustard* (sometimes used also for any plant of the genus); for *S. Sophia*, see *herb-roplea*; and for *S. Irio*, see *London-rocket*. *S. canerens* is the tansy-mustard of the western United States, and *S. Thaliana* the mouse-ear cress of Europe, naturalized in the eastern United States.

**Sisyrinchia** (sis-i-ring-kī'ē-ē), *n. pl.* [*NL. (Bentham and Hooker, 1833), < Sisyrinchium + -ia.*] A tribe of monocotyledonous plants of the order *Iridæ*. It is characterized by commonly terminal or peduncled spathe, by concave or keeled bracts within the spathe and opposite to the two or more usually pedicelled flowers, and by style-branches alternate with the anthers or borne on a style which is longer than the stamens. It includes 26 genera, classed in 4 subtribes, of which *Crocus*, *Cipura*, *Sisyrinchium*, and *Aristea* are the types. The first, the *Crocæ*, are exceptional in their one-flowered spathe; they are largely South African and Australian. The *Cipuræ* and a few genera besides are American. The tribe includes both bulbous plants, as the *Crocus*, and others with a distinct creeping or upright rootstock, which is, however, in a larger number reduced to a cluster of thickened fibers. See *Pateronia* and *Pardanthus*.

**Sisyrinchium** (sis-i-ring'ki-um), *n.* [*NL. (Tournefort, 1700), transferred by Linnæus from the iris; < Gr. σισυρινχιον, a bulbous plant, said to have been of the iris family.*] A genus of plants of the order *Iridæ*, type of the tribe *Sisyrinchieae* and of the subtribe *Eusisyrinchieae*. It is characterized by round or two-edged stems without a bulbous base, rising from a cluster of thickened fibers; flowers with the filaments commonly partly united into a tube, and with three slender undivided style-branches; and a globose ovary which becomes an exerted capsule in fruit. There are about 50 species, all American, occurring both in the tropical and in the temperate zones, one species also indigenous in Ireland. They are tufted plants with numerous flat, long, and narrow upright leaves which are all or mostly radical, and usually a single spathe with numerous open flatish flowers. The two species of the eastern United States, *S. angustifolium* and *S. aeneus*, are known as *blue-eyed grass*, from the flowers. See *rush-lily*.

Or if you carry a tumbler full of milk up-stairs, and what De Quincey would call the 'titubation' of your gait causes a row of drops of milk on the stair-carpet to mark your upward course, . . . you are said to have *skeddaded* the milk."

In *anat.*, the dry bones of the body taken together; hence, in *anat.* and *zool.*, some or any hard part, or the set of hard parts together, which form a support, scaffold, or framework of the body, sustaining, inclosing, or protecting soft

More specifically—(a) The test, shell, lorica, or set of spicules of any protozoan, as an infusorian, radiolarian, foraminifer, or other animalcule, exhibiting the utmost diversity of form, structure, and substance. See cuts under *Foraminifera*, *Infusoria*, and *Radiolaria*. (b) In sponges, the whole sponge except the animalcules which fabricate it. (See cut under *Porifera*.) A bath-sponge, for example, is only the skeleton, from which the animals have been decomposed and displaced. This skeleton presents itself in three principal textures, the fibrous, chalky, and glassy. In a few cases it is gelatinous. (See *Fibrospongia*, *Calcispongia*, *Silicispongia*, *Myxospongia*.) A nearly constant and very characteristic feature of sponge-skeletons is the presence of calcareous or silicious spicules. (See *spicule*.) Spicules in excess of fibrous tissue, and especially when consolidated in a kind of network, form the glass-sponges, some forms of which are very beautiful. (See cut under *Euplectella*.) Certain minute sponges of some sponges are flesh-spicules, and belong to the individual sponge-animalcules rather than to the general sponge-tissue. (Compare *microsclere* with *megascclere*.) (c) The special or general hard parts of echinoderms, as the shell of a sea-urchin with its spines and oral armature; the spicules or scleres in the integument of a holothurian; the rigid parts of starfishes, crinoids, and the like. These skeletons are for the most part exoskeletons. See cuts under *Clypeastridae*, *Echinometra*, *Echinus*, and *sea-star*. (d) The chitinated or calcified integument or crust of arthropods, as insects or crustaceans, as the shell of a crab, etc. (e) The shell, or valves of the shell, of a mollusk or molluscoid, as an oyster-shell or snail-shell. fishes the whole skeleton is cartilaginous. In most vertebrates, however, the cartilage forming the skeleton of the embryo or fetus is mainly converted into bone by the process of ossification, or deposition of bone-earth, some parts, especially of the ribs, remaining as a rule cartilaginous. The vertebrate endoskeleton consists of axial parts, the *axial skeleton*, in a series of consecutive segments, the vertebrae, with their immediate offshoots, as ribs, and at the head end a skull or cranium (except in the *Acerania* or lowest fishes); and of appendages, the *appendicular skeleton*, represented by the one or two (never more) pairs of limbs, if any, including the pectoral and pelvic arch, or shoulder- and hip-girdle, by means of which the limbs are attached to the axis or trunk. Various other ossifications may be and usually are developed in

tendinous or ligamentous tissue, or in viscera, and constitute the *retroskeleton* or *epi-ancho-skeleton*. Teeth are certainly skeletal parts, though not usually counted with

the bones of the skeleton; they are horny, not osseous or dentinal, in some animals. The human skeleton consists of about 200 bones, without counting the teeth—the enumeration varying somewhat according as the skeletal sesamoid bones are or are not included. See *sesamoid*. (2) The external covering of the body; the cuticle or epidermis; the dermo-skeleton or exo-skeleton, including all the non-vascular, non-nervous cuticular or epidermal structures, as horns, hoofs, claws, nails, hairs, feathers, scales, etc. In man the exo-skeleton is very slight, consisting only of cuticle, nails, and hair; but in many vertebrates it is highly developed and may be bony, as in the shells of armadillos and of turtles, the plates, shields, or bucklers of various reptiles and fishes, etc. See also cuts under *archipterygium*, *carapace*, *Catarrhina*, *elasmobranch*, *Elephantina*, *endoskeleton*, *epileura*, *Equidae*, *fish*, *Ichthyornis*, *Ichthyosaurus*, *Ichthyosaurus*, *Mastodontine*, *Myodon*, *or*, *Plesiosaurus*, *ptero-dactyl*, and *Pteropodidae*; also cuts under *skull*, and others there named.

A skull is possessed by all vertebrates excepting the lance-  
lets, and by no other animals. It is sometimes divided  
into the skull proper, cranium in strictness or brain-box,  
and the facial region or face. In the adult human skull  
eight cranial and fourteen facial bones are commonly enu-  
merated, though the real number of osseous elements is  
much larger. The eight cranial bones are the occipital,  
two parietal, two temporal, frontal, sphenoid, and ethmoid.  
The fourteen facial bones are two nasals, two lacrymals, two  
superior maxillaries, two malars, two palatals, two inferior  
turbinals, one inferior maxillary, and one vomer. This enu-  
meration of the bones is exclusive of the bonelets of the ear,  
which, however, are counted in vertebrates below mam-  
mals. Of these bones, the mandible, vomer, and frontal  
are really paired, or of lateral halves; the supramaxillary,  
ethmoid, sphenoid, occipital, and temporal are compound  
bones of several separate centers of ossification; the rest  
are simple. The most composite bone is the temporal,  
whose ankylosed stylohyoid process (peculiar to man) is an  
element of the hyoid arch. A skull of similar construction  
characterizes mammals at large, though its figure is usually  
quite different (owing mainly to production of the facial  
and reduction of the cranial parts), and though some of the  
bones which are confluent in man may remain distinct. In  
birds the skull is characterized by the great size of the cran-  
ial bones in comparison with that of the facial bones (ex-

cepting the specially enlarged intermaxillary and infra-  
maxillary, the extensive and complete ankyloses of cranial  
bones, the permanent and perfect distinctness of pterygoid

bones, the formation of each half of the lower jaw by several  
recognizable pieces, and especially by the intervention  
of a movable quadrate bone between the squamosal and  
the mandible. Some other additional bones make their  
appearance; and the occipital condyle is always single. A  
skull of similar construction to that of birds characterizes  
reptiles proper; but here again the cranial is small in com-  
parison with the facial region (as in the lower mammals),  
sometimes excessively so; the skull is more loosely con-  
structed, with fewer ankyloses of its several elements; and  
some additional bones not found in any higher vertebrates  
first appear. The skulls of batrachians differ widely from  
all the above. Some additional elements appear; some  
usually ossified elements may be persistently cartilagi-  
nous; and branchial as well as hyoidian arches are seen  
to be parts of the skull. The further modifications of  
the skull in fishes are great and diversified: not only is  
there much variation in the skulls of different fishes,  
but also the difference between any of their skulls and  
those of higher vertebrates is so great that some of the  
bones can be only doubtfully homologized with those of  
higher vertebrates, while of others no homologues can be  
recognized. In these ichthyosplan vertebrates, also, the  
skull is sometimes permanently cartilaginous, as in selac-  
hians; in the lampreys the lower jaw disappears; in the  
lancelets there is no skull. In fishes, also, more or fewer  
branchial arches are conspicuous parts of the skull,  
forming usually, with the compound lower jaw, by far the  
bulkier section of this collection of bones; and in some of  
them the connection of the shoulder-girdle with the skull  
is such that it is not always easy to say of certain bones  
whether they are more properly scapular or cranial. The  
natural evolution of the skull is, of course, from the lower  
to the higher vertebrates (the reverse of that above  
sketched). Above lampreys and lings, after a lower jaw  
has been acquired, the general course of evolution of the  
skull is to the reduction in number of its bones or car-  
tilages by the entire disappearance of some and the conflu-  
ence of others, tending on the whole to the compactness,  
simplicity, and symmetry of which the human skull is the  
extreme case, and in which, as in the skull of any mam-  
mal or bird, evidences of its actual osseous elements are  
chiefly to be traced in the transitory centers of ossification  
of the embryo. A good illustration of this is witnessed in  
the condition of the bones of the tongue (hyoid arch) in  
mammals; for even in birds (next below mammals) the  
tongue has a skeleton of several distinct bones, the pos-  
ition of which in a series of arches next after the mandib-  
ular and next before the branchial arches proper is evi-  
dent. The base of the skull is generally laid down in ear-  
ly life. The dome of the skull and the facial parts are usu-  
ally of membrane-bones; and to the latter some dermal  
or exoskeletal bones may be added. Facial parts of all  
skulls are of different character from cranial parts proper,  
in that they belong essentially to the series of visceral  
(hemal, not neural) arches: (1) upper jaw; (2) under jaw;  
(3) tongue (hyoid), followed by more or fewer successive  
branchial arches. The neural arches, or cranial segments  
proper, are at least 3 (some count 4) in number, named  
occipital, parietal, and frontal, from behind forward, rep-  
resented respectively by (1) the occipital bone; (2) the  
basisphenoid, alisphenoid, and parietal bones; (3) the  
presphenoid, orbitosphenoid, and frontal bones. With  
these are intercalated or connected the sense-capsules of  
the three higher senses—namely, of hearing, sight, and  
smell—these being the skeletons of the ear, eye, and nose,  
and the petrosal parts of the temporal, the sclerotic coat  
of the eye, and the lateral masses of the ethmoid bone. Re-  
maining hard parts of the head, and, as such, elements of  
the skull, are the teeth, borne on more or fewer bones: in  
mammals, when present, confined to the premaxillaries,  
supramaxillaries, and infra-maxillaries; not present in any  
existing birds; in various reptiles and fishes, absent, or

borne upon the bones above named, and also, in that  
case, upon the sphenoid, vomer, palatals, pterygoids, hy-  
oids, pharyngeals, etc. The body of facts or principles  
concerning skulls is craniology, of which cranometry is  
one department, especially applied to the measurement of  
human skulls for the purposes of ethnography or anthro-  
pology. For the human skull (otherwise than as here

Common Skunk (*Mephitis mephitis*)

skunk early attracted attention. It is mentioned in 1636 by Sagard-Théodat by several terms based on its Indian names, as *seangaresse*, *ouineque*, etc., and in the same passage, in his "History of Canada," this author calls it in French "*enfant du diable*," a name long afterward quoted as specific. It is the *fiskatta* of Kalm's "Travels," commonly translated *polecats*, a name, however, common to various other ill-scented *Mustelidae*. (See def. 2.) *Chinche*, *chinga*, and *moufette* (specifically *moufette d'Amérique*) are book-names which have not been Englished. The New Latin synonyms are numerous. The animal inhabits all of temperate North America, and continues abundant in the most thickly settled regions. It is about as large as a house-cat, but stouter-bodied, with shorter limbs, and very long bushy tail, habitually erected or turned over the back. The color is black or blackish, conspicuously but to a variable extent set off with pure white—generally as a frontal stripe, a large crown-spot, a pair of broad divergent bands along the sides of the back, and white hairs mixed with the black ones of the tail. The fur is valuable, and when dressed is known as *Ataska saddle*; the blackest pelts bring the best price. The flesh is edible, when prepared with sufficient care. The skunk is carnivorous, like other members of the same family, with which its habits in general agree; it is very prolific, bringing forth six or eight young in burrows. The fluid which furnishes the skunk's almost sole means of defense was long supposed and is still vulgarly believed to be urine. It is the peculiar secretion of a pair of perineal glands (first dissected by Jeffries Wyman in 1844), similar to those of other *Mustelidae*, but very highly developed, with strong muscular walls, capacious reservoir, and copious golden-yellow secretion, of most

Also called *sky-lavrock*, *rising-lark*, *field-lark*, *short-heeled lark*, etc. The name extends to some other true larks, and also to a few of the pipits.—**Australian skylark**, a dictionary name of an Australian bird, *Cinclothruphus cantillans* (or *cruralis*), which may have a habit of rising on wing to sing. Its systematic position is disputed, but it is neither a lark nor a pipit. It is about 9 inches long, and of varied brownish and whitish coloration. *The Field*, April 4, 1885. (*Encyc. Diet.*)

*slang*<sup>3</sup> (slang), *n.* [Of obscure cant origin; the form suggests a connection with *sling*, in a way indicated by the use of *sling* and *fling* in 'to sling epithets,' 'to fling reproaches,' etc., and by similar uses of related Scand. forms, as Norw. *sleng*, a slinging, a device, a burden of a song; *slengja*, sling (*slengja kjeften*, abuse, lit. 'sling the jaw'); *slengjenamn*, a nickname; *slengje-ord*, an insulting word or allusion; Icel. *slyngj*, *slyngum*, cunning: see *sling*<sup>1</sup>.] The noun, in this view, must have arisen in quasi-composition (*slang*-patter, *slang*-word, *slang*-name, etc.), or else from the verb. Evidence of early use is lacking. The word has nothing to do with *language* or *lingo*, and there is no evidence to establish a Gipsy origin.] 1. The cant words or jargon used by thieves, peddlers, beggars, and the vagabond classes generally; cant.

*Slang* in the sense of the cant language of thieves appears in print certainly as early as the middle of the last century. It was included by Grose in his "Dictionary of the Vulgar Tongue," published in 1785. But it was many years before it was allowed a place in any vocabulary of our speech that confined itself to the language of good speakers and writers. Its absence from such works would not necessarily imply that it had not been in frequent use. Still, that this never had been the case we have direct evidence. Scott, in his novel of "Redgauntlet," which appeared in 1824, when using the word, felt the necessity of defining it; and his definition shows not only that it was generally unknown, but that it had not then begun to depart at all from its original sense. In the thirteenth chapter of that work, one of the characters is represented as trying to overhear a conversation. . . . but . . . "what did actually reach his ears was disguised so completely by the use of cant words and the thieves' Latin called *slang* that, even when he caught the words, he found himself as far as ever from the sense of their conversation." No one who is now accustomed either to speak *slang* (in def. 2), or to speak of the users of it, would think of connecting it with anything peculiar to the language of thieves. Yet it is clear from this one quotation that the complete change of meaning which the term has undergone has taken place within a good deal less than sixty years.

*The Nation*, Oct. 9, 1890, p. 289.

Let proper nurses be assigned, to take care of these babes of grace (young thieves). . . . The master who teaches them should be a man well versed in the cant language commonly called the *slang* patter, in which they should by all means excel.

2. In present use, colloquial words and phrases which have originated in the cant or rude speech of the vagabond or unlettered classes, or, belonging in form to standard speech, have acquired or have had given them restricted, capricious, or extravagantly metaphorical meanings, and are regarded as vulgar or inelegant. Examples of *slang* are *rum* for 'queer,' *gay* for 'dissolute,' *corned*, *tight*, *stued*, etc., for 'intoxicated,' *awfully* for 'exceedingly,' *jolly* for 'surprising, uncommon,' *daisy* for something or somebody that is charming or admirable, *kick the bucket* or *hop the twig* for 'die,' etc. This colloquial *slang* also contains many words derived from thieves' cant, such as *pal* for 'partner, companion,' *cove* for 'fellow,' and *ticker* for 'watch.' There is a *slang* attached to

certain professions, occupations, and classes of society, such as racing *slang*, college *slang*, club *slang*, literary *slang*, political *slang*. (See *cant*.) *Slang* enters more or less into all colloquial speech and into inferior popular literature, as novels, newspapers, political addresses, and is apt to break out even in more serious writings. *Slang* as such is not necessarily vulgar or ungrammatical; indeed, it is generally correct in idiomatic form, and though frequently censured on this ground, it often, in fact, owes its doubtful character to other causes. *Slang* is often used adjectively: as, a *slang* expression. See the quotations below.

The smallest urchin whose tongue could tang  
Shock'd the dame with a volley of *slang*.  
*Hood*, *Tale of a Trumpet*.

Cant, as used in the phrases "thieves' cant," "tinkers' cant," "printers' cant," or the cant of any craft or calling, is really a language within a language, and is intended to conceal the thoughts of those who utter it from the uninitiated. *Slang*, on the other hand, is open to all the world to use, and its ranks are recruited in various ways. *N. and Q.*, 7th ser., VIII. 341.

*Center slang*, thieves' *slang* in which the middle vowel of a word is taken as its initial letter, and other letters or syllables are added to give the word a finish, as *lock* becomes "ockler," *pitch*, "itchper," etc. *Ribton-Turner*, *Vagrants and Vagrancy*, p. 478.—*Riming slang*, a kind of cant or secret *slang* spoken by street vagabonds in London, consisting of the substitution of words or sentences which rhyme with other words or sentences intended to be kept secret: as, "apples and pears" for *stairs*; "Cain and Abel" for *a table*. See *back-slang*. =Syn. 2. *Slang*, *Colloquialism*, etc. See *cant*<sup>2</sup>.

3. A rock the most striking characteristic of which is its fissile structure, or capability of being easily split or cleft into thin plates of nearly uniform thickness and smooth surfaces. The rocks in which a fissile structure is particularly well developed are almost exclusively the argillaceous, and those which have been more or less metamorphosed, and this fissility appears to be the result of the rearrangement of the particles of the rock into new combinations flattened into thin scales which lie in a direction at right angles to the direction in which the rock was pressed at the time the metamorphism was taking place. The best-known variety of slate is the common roofing-slate, which is compact, homogeneous, and fissile enough to be used for covering roofs, or for manufacture into tables, chimney-pieces, writing-slates, etc. The valuable varieties of roofing-slate come almost exclusively from the older metamorphic rocks. (See *cleavage and foliation*.) North Wales is by far the most important slate-producing region of the world, some beds having been worked there as early as the twelfth century. The principal quarries are in southern Carnarvonshire and Merionethshire in the Lower Silurian, and in Montgomeryshire in the Upper Silurian. There are also quarries in Cornwall in the Devonian, and slates of the same geological age are obtained in France in considerable quantity, as well as in parts of Germany adjacent to the Rhine. There are various quarries in Devonshire in the Carboniferous; but in most of them the slate furnished is not of first-rate quality; and, in general, it may be said that the Carboniferous is the highest geological formation producing what can properly be denominated *slate*. The slate of the United States comes almost entirely from a very low position in the geological series, as is also the case in Europe. Pennsylvania and Vermont are the principal slate-producing States, and they together furnish more than two thirds in value of the total production of the country.

It is recognized in the Old Testament as a prevailing custom, and the Levitical laws contain many regulations in regard to slaves and their rights and duties. Serfdom died out gradually in England in the latter part of the middle ages, and slavery was abolished throughout the British empire in 1833, after long agitation, the sum of twenty million pounds sterling being paid as compensation to the slave-owners. Negro slavery was introduced into the present territory of the United States in 1620, and became recognized as an institution. The Northern States gradually got rid of their slaves by emancipation or transportation in the latter part of the eighteenth and the early part of the nineteenth century. Slavery became a leading and agitating question from the time of the Missouri Compromise (1820), and the number of slave States increased to fifteen. (See *slave State*, under *slave*<sup>2</sup>, a.) President Lincoln, by his Emancipation Proclamation of January 1st, 1863, declared free all slaves in that part of the Union designated as in rebellion; and the thirteenth amendment to the Constitution, 1865, abolished slavery within the United States. Slavery has been abolished by various other countries in the nineteenth century, as by Brazil in 1888.

6. In *bot.*, to assume a state, as regards vegetable functions, analogous to the sleeping of animals. See *sleep*, *n.*, 5.

7. To be or become numb through stoppage of the circulation: said of parts of the body. See *asleep*.—**Sleeping partner.** See *partner*.—**To sleep upon both ears.** See *earl*. = Syn. 1 and 2. *Drowse, Doze, Slumber, Sleep*, nap, rest, repose. The first four words express the stages from full consciousness to full unconsciousness in sleep. *Sleep* is the standard or general word. *Drowse* expresses that state of heaviness when one does not quite surrender to sleep. *Doze* expresses the endeavor to take a sort of waking nap. *Slumber* has largely lost its earlier sense of the light beginning of sleep, and is now more often an elevated or poetical word for *sleep*.

II. *trans.* 1. To take rest in: with a cognate object, and therefore transitive in form only: as, to *sleep* the sleep that knows no waking.

**sleep** (slēp), *n.* [*< ME. sleep, slepe, slep, slape, slep, < AS. slāp = OS. slāp = OFries. slēp = D. slāp = MLG. LG. slāp = OHG. slāfan, MHG. slāfen, G. schlafen = Goth. slāpan (redupl. pret. saislēp), sleep; cf. MLG. LG. slāp (> G. schlapp) = OHG. No cognate form of this verb is found in Scand. (where another verb, cognate with the L., Gr., and Skt. words for 'sleep,' appears: see *serēn*).] I. *intrans.* 1. A state of general marked quiescence of voluntary and conscious (as well as many involuntary and unconscious) functions, alternating more or less regularly with periods of activity. In human sleep, when it is deep, the body lies quiet, with the muscles relaxed, the pulse-rate lower than during the waking hours, and the respiration less frequent but deep, while the person does not react to slight sensory stimuli. Intestinal peristalsis is diminished; secretion is less actively carried on; the pupils are contracted; and the brain is said to be anemic. If the depth of sleep is measured by the noise necessary to awaken the sleeper, it reaches its maximum within the first hour and then diminishes, at first rapidly, then more slowly.*

Half in a dreame, not fully weel a-wakid,  
The golden sleep me wrapt vndir his wing.  
Political Poems, etc. (ed. Furnivall), p. 62.

Else could they not catch tender *sleep*; which still  
Is shy and fearful, and flies every voice.  
J. Beaumont, Psyche, iv. 41.

*Sleep* is a normal condition of the body, occurring periodically. In which there is a greater or less degree of unconsciousness due to inactivity of the nervous system and more especially of the brain and spinal cord. It may be regarded as the condition of rest of the nervous system during which there is a renewal of the energy that has been expended in the hours of wakefulness.  
Encyc. Brit., XXII. 154.

2. A period of sleep: as, a short *sleep*.  
It seems his *sleeps* were hindered by thy railing.  
Shak., C. of L., v. 1. 71.

W. James, Prin. of Psychol., I. 201.

3. Repose; rest; quiet; dormancy; hence, the rest of the grave; death.

Here are no storms,  
No noise, but silence and eternal *sleep*.  
Shak., Tit. And., I. 1. 155.

A calm, unbroken *sleep*  
Is on the blue waves of the deep.  
Prentice, To an Absent Wife.

4. Specifically, in *zool.*, the protracted and profound dormancy or torpidity into which various animals fall periodically at certain seasons of the year. Two kinds of this sleep are distinguished as *summer* and *winter sleep*, technically known as *estivation* and *hibernation* (see these words).

5. In *bot.*, nyctitropism, or the sleep-movement of plants, a condition brought about in the foliar or floral organs of certain plants, in which they assume at nightfall, or just before, positions unlike those which they have maintained during the day. These movements in the case of leaves are usually drooping movements, and are therefore suggestive of rest, but the direction of movement is different

in different cases. Thus, among the *Orobanchaceae* the sleep-movement consists in the downward sinking of the leaflets, which become at the same time folded on themselves. Among the *Leguminosae*, the leaflets, in some cases, simply sink vertically downward (*Phaseolus*); in others, they sink down while the main petiole rises (terminal leaflet of *Desmodium*); in others, they sink downward and twist on their axes so that their upper surfaces are in contact beneath the main petiole (*Cassia*); in others, again they rise and bend backward toward the insertion of the petiole (*Coronilla*); in others, they rise, and the main petiole rises also, whereas in *Mimosa pudica* the leaflets rise and bend forward, while the main petiole falls. In *Marrubium* the leaflets rise up, the two upper ones being embraced by the two lower. (S. H. Vines.) The mechanism of these movements is explained by Pfeffer and others as due to an increased growth on one side of the median line of the petiole or midrib, followed, after a certain interval of time, by a corresponding growth on the opposite side. It is also accomplished by simple turgescence of opposite sides. The utility of the sleep-movement is believed to consist in protection from too great radiation. The cause or causes of these movements (and of analogous movements which have been called *diurnal sleep*: see the second quotation) are only imperfectly known, but they are undoubtedly largely due to sensibility to variations in the intensity of light. See *nyctitropism*.

Those movements which are brought about by changes in the amount of light constitute what are known as the "sleep" and "waking" of plants. *Bessey, Botany*, p. 168.

There is another class of movements, dependent on the action of light. . . . We refer to the movements of leaves and cotyledons which when moderately illuminated are diheliotropic, but which change their positions and present their edges to the light when the sun shines brightly on them. These movements have sometimes been called *diurnal sleep*. *Darwin, Movement in Plants*, p. 445.

On *sleep*, *asleep*. See *asleep*.

For David, after he had served his own generation by the will of God, fell on *sleep*, and was laid unto his fathers.

(b) In *mil. engin.*, one of the small joists of wood which form the foundation for a battery platform. (c) A piece of wood, metal, or other material upon which the rails or the rail-chairs of a railway rest, and to which they are fastened. Wood of durable varieties is far more extensively used for this purpose than any other material; but stone, toughened glass, and iron have also been used, the last to a considerable extent. In some instances the sleepers are laid longitudinally with the rails, and bound together by cross-ties. This system is in use on some important European railways, and generally on elevated railways and street railways, both in the United States and elsewhere; but the most common method is to lay the sleepers at right angles to the rails, and about 2 feet from center to center, except when they support points and angle-bars, when they are placed 1 foot 6 inches from center to center. They are thus made to act both as sleepers and as cross-ties. Such sleepers are in the United States also called *railway-ties* or simply *ties*. See *cut* under *rail-chair*.

*Dawson*, *Geol. Hist. Plants*, p. 105.

*slickensides* (slik'n-sídz), *n. pl.* [ < *slicken* + *sides*, pl. of *side*<sup>1</sup>. ] In *mining*, polished and striated surfaces of the rock, often seen on the walls of fissure-veins, and the result of motion, under immense pressure, of parts of the country-rock, or of the mass of the vein itself. Well-developed slickensides are most frequently seen in connection with mineral veins, but the sides of joints in non-metallic rocks occasionally exhibit this kind of striation. Slickensided surfaces are frequently coated with a thin film of pyrites, galena, hematite, or some other mineral, which may be polished so as to reflect the light like a mirror (whence the French name *miroirs*).

Nearly akin to this jointed character are the *slickensides*, or polished and striated surfaces, which, sometimes of iron pyrites, but more usually of copper pyrites, often cover the faces of the walls of lodes.

*Hemwood*, *Metallic Deposits of Cornwall and Devon*, p. 181.

*slickensiding* (slik'n-sí' ding), *n.* [ < *slickenside* + *-ing*. ] The formation of slickensides.

In every case I think these bodies must have had a solid nucleus of some sort, as the severe pressure implied in *slickensiding* is quite incompatible with a mere "fluid-cavity," even supposing this to have existed.

*Dawson*, *Geol. Hist. Plants*, p. 35.

The slide is the distinctive feature of the trombone; but it is also used in the true trumpet, and occasionally in the French horn. As facilitating alterations of pitch in pure intonation, it has decided advantages over both keys and valves. (d) In *organ-building*, same as *slider*, 1 (f). (e) In *racing boats*, a sliding seat. Also *slider*.

It may be moved from side to side so as either to admit the air from the pallets to the pipes or to cut them off entirely. The position of a slider is controlled by a stop-knob at the keyboard. By drawing the knob the slider of a set of pipes is pushed into such position that they may be sounded by the digitals. Also *slide*. See *organ*, 1, stop, and *wind-chest*. (g) In *racing boats*, a sliding seat.

The valve-rod derives a reciprocating motion from the rock-lever *d*, pivoted at *e* and connected at the lower end with the eccentric-rod *h*, the latter being reciprocated by the eccentric *g*. *d*, *d'*, induction-ports which also alternately act as exhaust-ports; *e*, exhaust-ports; *f*, piston or connecting rod which, being connected to the piston-rod *k* reciprocated by the piston *j*, imparts circular motion to the crank *f*, crank-shaft *j'*, and eccentric *g*.

4. A South American tardigrade edentate mammal of the family *Bradypodidae*: so called from their slow and apparently awkward or clumsy movements. The slowness of their motions on the ground is the necessary consequence of their disproportioned structure, and particularly of the fact that the feet exhibit a conformation resembling that of clubfoot in man—a disposition of the carpal and tarsal joints highly useful in climbing. Sloths live on trees, and never remove from one until they have stripped it of every leaf. They are helpless when on the ground, and seem at home only on trees, suspended beneath the branches, along which they are sometimes observed to travel from tree to tree with considerable celerity. The female produces a single young one at a birth, which she carries about with her until it is able to climb. Sloths are confined to the wooded regions of tropical America, extending northward into Mexico. At least 12 species are described, but the true number is fewer. All have three toes on the hind feet, but some have only two on the fore feet, whence the obvious distinction of *three-toed* and *two-toed* sloths (a distinction even more strongly marked in the anatomy of these animals) warranted a division of the family into *bradypodinae* (*Bradypodinae*) and *chelopodinae* (*Chelopodinae*). Most sloths belong to the former group, and these have the general name *ai*. The best-known of these is the collared three-toed sloth, *Bradypus tridactylus* or *torquatus*, with a sort of mane. The unia or two-toed sloth, *Cholopus didactylus*, inhabits Brazil; it is entirely covered with long coarse woolly hair. (See cut under *Cholopus*.) A second and quite distinct species of this genus, *C. hoffmanni*, inhabits Central America. (See *Tardigrada*, 1.) The name is apparently a translation of the Portuguese word *preguiça* (Latin *pigritia*), slowness, slothfulness. See the quotation.

Here (in Brazil) is a Beast so slow in motion that in fifteen days he cannot go further than a man can throw a stone; whence the Portuguese call it *Pigritia*.

**smell** (smel), *n.* [< ME. *smel*, *smil*, *smul*, *smcal*, *smcal* (not found in AS.); see the verb.] 1. The faculty of perceiving by the nose; sense-perception through the olfactory nerves; the olfactory faculty or function; the physiological process or function whereby certain odoriferous qualities of bodies, as scent or effluvium, are perceived and recognized through sensation; olfaction; scent: often with the definite article, as one of the special senses; as, the *smell* in dogs is keen. The essential organ of smell is located in a special part or lobe of the brain, the rhinencephalon, or olfactory lobe, whence are given off more or fewer olfactory nerves, which pass out of the cranial cavity into the nasal organ, or nose, in the mucous or Schneiderian membrane of the interior of which they ramify, so that air laden with odoriferous particles can affect the nerves when it is drawn into or through the nasal passages. In man the sense of smell is very feeble and imperfect in comparison with that of many animals, especially of the carnivores, which pursue their prey by scent, and ruminants, which escape their enemies by the same means. Smell in the lower animals seems to be the guiding sense in determining their choice of food.

Memory, imagination, old sentiments and associations, are more readily reached through the sense of *smell* than by almost any other channel. *O. W. Holmes*, Autocrat, IV.

*Smell* is a sensation excited by the contact with the olfactory region of certain substances, usually in a gaseous condition and necessarily in a state of fine subdivision. *Encyc. Brit.*, XXII. 165.

3. A faint impression; a subtle suggestion; a hint; a trace; as, the poem has a *smell* of the woods.—4. An act of smelling; as, he took a *smell* at the bottle. = *syn.* *Smell*, *Scent*, *Odor*, *Savor*, *Perfume*, *Fragrance*, *Aroma*, *Stench*, *Stink*. *Smell* and *scent* express the physical sense, the exercise of the sense, and the thing which appeals to the sense. The others have only the last of these three meanings. Of the nine words the first four may express that which is pleasant or unpleasant, the next three only that which is pleasant, the last two only that which is very unpleasant. *Smell* is the general word; the others are species under it. *Scent* is the smell that proceeds naturally from something that has life; as, the *scent* of game; the *scent* of the tea-rose. *Odor* is little more than a Latin substitute for *smell*; as, the odor of musk, of decaying vegetation; it may be a dainty word, as *smell* cannot be. *Savor* is a distinctive smell, suggesting taste or flavor, proceeding especially from some article of food; as, the *savor* of garlic. *Perfume* is generally a strong or rich but agreeable smell. *Fragrance* is best used to express fresh, delicate, and delicious odors, especially such as emanate from living things; as, the *fragrance* of the violet, of new-mown hay, of the breath of an infant. *Aroma* should be restricted to a somewhat spicy smell; as, the *aroma* of roasted coffee, or of the musk-rose. *Stench* and *stink* are historically the same word, in different de-

grees of strength, representing a strong, penetrating, and disgusting odor; *stink* is not for polite use.

**smellable** (smel'ə-bl), *a.* [< *smell* + *-able*.] Capable of being smelled. [Rare.]

Connection with *melt* is doubtful.] 1. *trans.* To fuse; melt; specifically, to treat (ore) in the large way, and chiefly in a furnace or by the aid of heat, for the purpose of separating the contained metal. Metallurgical operations carried on in the moist way, as the amalgamation of gold and silver ores in pans, treatment by lixiviation, etc., are not generally designated by the term *smelting*. Establishments where this is done are more commonly called mills or reduction-works, and those in which iron is smelted are usually designated as blast-furnaces or iron-furnaces. The vari-

ous smelting operations differ greatly from each other, according to the nature of the combinations operated on. Simple ores, like galena, require only a very simple series of operations, which are essentially continuous in one and the same furnace; more complicated combinations, like the mixtures of various cuprifera ores smelted at Swansea by the English method, require several successive operations, entirely disconnected from each other, and performed in different furnaces. In the most general way, the essential order of succession of the various processes by which the sulphureted ores (and most ores are sulphureted) are treated is as follows: (1) calcination or roasting, to oxidize and get rid (as far as possible) of the sulphur; (2) reduction of the metal contained in the oxidized combinations obtained; (3) refining, or getting rid of the last traces of deleterious metals associated in the ore with the useful metal, to obtain which is the essential object of the operation.

**smelt**<sup>2</sup> (smelt), *n.* [*ME. smelt*, < *AS. smelt* = *Norw. smelta* = *Dan. smelt*, a smelt (applied to various small fishes); perhaps so called because it was 'smooth'; cf. *AS. smolt*, *smolt*, serene, smooth (as the sea); see *smolt*<sup>2</sup>.] 1. Any one of various small fishes. (a) A small fish of the family *Argentinidae* and the genus *Osmorus*. The common European smelt is the sparring, *O. eperlanus*; it becomes about 10 to 12 inches long, and is of an olive-green above and a silvery white below, with a silver longitudinal lateral band. It exhales when fresh a peculiar scent suggesting the cucumber. This fish is prized as a delicacy. The corresponding American smelt is *O. mordax*, of the Atlantic

coast from Virginia northward, anadromous to some extent, and otherwise very similar to the sparring. There are several true smelts of the Pacific coast of North America, as *O. thaleichthys*, the Californian smelt, and *O. dentex*, the Alaska smelt. Hence—(b) Any other species of the family *Argentinidae* related to the smelt, such as the *Hypomesus pretiosus* or *olitus*, also called *surf-smelt*, which is distinguished from the true smelts by having the dorsal fin mostly advanced beyond the ventrals and by the much smaller mouth and weak teeth. It inhabits the Pacific coast of the United States from California northward, reaches a length of about 12 inches, and is highly esteemed as a food-fish. (c) In California, any species of the family *Atherinidae*, resembling the true smelt in general appearance, and provided with an anterior spinous and a posterior branched dorsal fin, and having the ventrals not far behind the pectorals. The common Californian smelt, *Atherinopsis californiensis*, reaches a length of about 18 inches, and its flesh is fine, firm, and of excellent flavor, though a little dry. It is one of the most important food-fishes of California, never absent from the markets. Other species are *Atherinops affinis*, the little smelt, and *Leuresthes tenuis*. (d) A freshwater cyprinoid, *Hybomachus regius*, which somewhat resembles the true smelt in form, translucency, and color; also, one of other cyprinoids, as the spawn-eater and the silversides. [Eastern U.S.] (e) A gadoid fish, *Microgadus proximus*, the tom-cod of the Pacific slope. [San Francisco.] (f) The smolt, a young salmon before its visit to the sea. [Eng.] (g) The lance or lant. They are somewhat delicate plants, producing an erect unbranched leafy stem from a creeping rootstock, and bearing alternate short-petioled leaves and small usually white or cream-colored flowers. Various tropical American species yield sarsaparilla. (See *sarsaparilla* and *china-root*.) *S. aspera* of the south of Europe, called *rough bindweed* or *prickly ivy*, is the source of Italian sarsaparilla. that man. Deut. xxix. 20.

smoke; fumigate: as, to *smoke* infected cloth-

incense. Smoking meat consists in exposing meat pre-  
viously salted, or rubbed over with salt, to wood-smoke  
in an apartment so distant from the fire as not to be  
unduly heated by it, the smoke being admitted by flues  
at the bottom of the side walls. Here the meat absorbs the  
emphyreumatic acid of the smoke, and is dried at the same  
time. The kind of wood used affects the quality and taste  
of the meat, smoke from beech and oak being preferable  
to that from fir and larch. Smoke from the twigs and ber-  
ries of juniper, or from rosemary, peppermint, etc., im-  
parts somewhat of the aromatic flavor of these plants. A  
slow smoking with a slender fire is better than a quick and  
hot one, as it allows the emphyreumatic principles time to  
penetrate into the interior without over-drying the out-  
side.

The stinking smut is caused by two species of fungus, which differ only in microscopic characters—*Tilletia tritici*, with rough spores, and *T. foetens*, with smooth spores. It is the most destructive disease of wheat known, not infrequently causing the loss of half of the crop or more. It occurs to some extent throughout all the wheat-growing regions, but is especially common in Indiana, Iowa, and adjacent States, as well as in California and Europe. The disease does not spread from plant to plant or from field to field, but the infection takes place at the time the seed sprouts. No remedy can be applied after the grain is sown, but the disease can be prevented by sowing clean seed in clean soil and covering well. Smutty seed can be purified by wetting thoroughly with a solution of blue vitriol, using one pound or more to a gallon of water. Thick smut may be similarly treated. *U. Maizis* is the smut of Indian corn; *U. destruens*, of *Sativa glauca*; *U. virens*, of many species of *Cereæ*, etc. See *Ustilago*, *Tilletia*, *maize smut*, *bunt*, *bunt ear*, *burnt ear*, *brand*, &c.

A bird of the genus *Scolopax* in a former broad sense. (a) Some or any bird belonging to the family *Scolopacidae*, having the bill straight, much longer than the head, dilated and sensitive at the end, and with a median lengthwise groove on the upper mandible near the end, the toes cleft to the base, the primaries not emarginate, and the tail-feathers barred; especially, a member of the genus *Gallinago* (*Scolopax* being restricted to certain woodcock). In Great Britain three species of *Gallinago* are called snipe. (1) The common snipe, or whole-snipe, is *Gallinago caelestis* or *G. media*, formerly *Scolopax gallinago*. (2) The great, double, or solitary snipe, or woodcock-snipe, is *G. major*. (3) The small snipe, half-snipe, or jack-snipe is *G. gallinula*. They differ little except in size. In the United States the common snipe, also called *jack-snipe* and *Wilson's snipe*, is *G. wilsoni* or *G. delicata*, about as large as *G. media*, which it very closely resembles, so that it is sometimes known as the "English" snipe, to distinguish it from various snipe-like birds peculiar to America, and also *boy-snipe*, *gutter-snipe*, *meadow-snipe*, *dwelfe-bird*, *shad-bird*, and *shad-spirit*. It is from 10 to 14 inches long and from 17 to 19 in extent of wings; the bill is about 2½ inches long. The upper parts are blackish, varied with bay and tawny; the scapulars are edged with tawny or pale buff, forming a pair of firm stripes along the sides of the back when the wings are closed; the lining of the wings and axillary feathers is barred regularly with black and white; the tail-feathers, normally sixteen in number, are barred with black, white, and chestnut; the fore neck and breast are light-brown speckled with dark-brown; and the belly is white. (See cut under *Gallinago*.) Snipes like these, and of the same genus, are found in most countries, and are called by the same name, with or without a qualifying term. (b) Some other *scolopacine* or snipe-like bird. There are very many such birds, chiefly distinguished from sandpipers (see *sandpiper*) by the length, from tattlers or gambets by the sensitiveness, and from curlews, godwits, etc., by the straightness of the bill. (1) In the United States the gray-backed or red-breasted snipes are birds of the genus *Macrorhamphus*, of which there are 2 species or varieties, the lesser and greater longbeak, *M. griseus* and *M. scolopaceus*. See *doitcheer*. (2) The grass-snipe is the pectoral sandpiper, *Actodromas maculata*. See cut under *sandpiper*. Also called *jack-snipe*. (3) The robin-snipe is the knot, *Tringa canutus*, also a sandpiper. (4) The stone-snipe is *Totanus melanoleucus*, a tattler. See cut under *yellowlegs*. (5) In Great Britain the sea-snipe is the dunlin, *Tringa or Pelidna alpina*, a sandpiper. (6) In Great Britain the summer snipe is the common sandpiper, *Actitis hypoleucis*. (7) Painted snipe are the curious birds of the genus *Rhyechaea* or *Rostratula*. See these words. (c) A common misnomer, in various localities, of the American woodcock, *Philohela minor*; also called common snipe, *big snipe*, *mud-snipe*, *red-breasted snipe*, *big-headed snipe*, *blind snipe*, *whistling snipe*, *wood-snipe*. See *woodcock*. (d) A misnomer of the long-billed curlew, *R. Ridgway*. (Salt Lake valley.) (e) *pl.* The *Scolopacidae*; the snipe family. [The plural means either two or more birds of one kind, or two or more kinds of these birds: in the former sense, the plural is generally *snipe*; in the latter, *snipes*.]

The aqueous vapor of the atmosphere precipitated in a crystalline form, and falling to the earth in flakes, each flake consisting of a distinct crystal, or more commonly of combinations of separate crystals. The crystals belong to the hexagonal system, and are generally in the form of thin plates and long needles or spicules; by their different modes of union

they present uncounted varieties of very beautiful figures. The whiteness of snow is due primarily to the large number of reflecting surfaces arising from the minuteness of the crystals. When sufficient pressure is applied, the slightly adhering crystals are brought into

molecular contact, and the snow, losing its white color, assumes the form of ice. This change takes place when snow is gradually transformed into the ice of a glacier. Precipitation takes the form of snow when the temperature of the air at the earth's surface is near or below the freezing-point, and the flakes are larger the moister the air and the higher its temperature. The annual depth of snowfall and the number of days on which the ground is covered with snow are important elements of climate. In a ship's log-book abbreviated as

**snow-line** (snō'lin), *n.* The limit of continual snow, or the line above which a mountain is continually covered with snow. The snow-line is due primarily to the decrease of the temperature of the atmosphere with increase of altitude. In general, the height of the snow-line diminishes as we proceed from the equator toward the poles; but there are many exceptions, since the position of the snow-line depends not only upon the mean temperature, but upon the extreme heat of summer, the total annual snowfall, the prevalent winds, the topography, etc. For these reasons, the snow-line is not only at different heights in the same latitude, but its position is subject to oscillation from year to year in the same locality. Long secular oscillations in the height of the snow-line are evidence of corresponding oscillations of climate. In the Alps the snow-line is at an altitude of 8,000 to 9,000 feet; in the Andes, at the equator, it is nearly 10,000 feet.

Between the glacier below the ice-fall and the plateau above it there must exist a line where the quantity of snow which falls is exactly equal to the quantity annually melted. This is the *snow-line*.

A modification of the latter is adapted to street-railroads. The snow-plow for ordinary country roads usually consists of a frame of boards braced together so as to form an acute angle in

front, and spread out behind to any required distance. The machine being drawn by horses harnessed to the center framework, the angular point enters the snow,

In recent forms the principle of centrifugal force has been utilized for removal of the snow. Snow-plows are often of great size, sometimes weighing fifty tons, and can be forced through very deep drifts.

The Canadian is a contracted oval in front and pointed behind, and is from 3 to 5 feet long and from 1 to 2 feet wide, the foot being fastened on the widest part of the shoe by means of thongs and so as to leave the heel free. It has a light rim of tough wood, on which is woven from side to side a web of rawhide. The Norwegian is merely a thin board, about 8 feet long and 3 inches wide, slightly curved upward in front; it is especially adapted to mountain, in descending which by its use great speed is attained. See *rice*.

**snow-snake** (snō'snāk), *n.* Among North American Indians, a slender shaft from 5 to 9 feet long, with a head curving up at one end and a notch at the other and smaller end; also, the game played with this shaft.

The game is simply one of dexterity and strength. The forefinger is placed in the basal notch, the thumb and remaining fingers reaching along the shaft, and the *snow-snake* is thrown forward on the ice or hard snow.

When the slender shaft is thrown, it glides rapidly over the surface, with upraised head and a quivering motion, that gives it a strange resemblance to a living creature. . . . The game is to see which person or side can throw it farthest, and sometimes the distance of a quarter of a mile is reached under favorable circumstances, but I think this rare.

A chemical compound in common domestic use for washing and cleansing, made by the union of certain fatty acids with a salifiable base. Fats and fixed oils consist of fatty acids combined with glycerin. On treating them with a strong base, like potash or soda, glycerin is set free, and the fatty acid combines with the strong base and forms a soap. Soap is of two kinds—*soluble* soap, in which the base is potash, soda, or ammonia, and *insoluble* soap, whose base is an earth or a metallic oxid. Only the soluble soaps dissolve readily in water and have detergent qualities. Insoluble soaps are used only in pharmacy for liniments or plasters. Of the fats, stearates make the hardest, oleates the softest soaps; and of the bases, soda makes the hardest and least soluble, and potash the softest and most soluble. Perfumes are occasionally added, or various coloring matters are stirred in while the soap is semi-fluid. White soaps are generally made of olive-oil and soda. Common household soaps are made chiefly of soda and tallow. Yellow soap is composed of tallow, rosin, and soda, to which some palm-oil is occasionally added. (See *rosin-soap*.) Mottled soap is made by simply adding mineral and other colors during the manufacture of ordinary hard soap. Marine soap, known as *salt-water soap*, which has the property of dissolving as well in salt water as in fresh, is made of palm- or cocoanut-oil and soda. Soft soaps are made with potash, instead of soda, and whale, seal, or olive-oil, or the oils of linseed, hemp-seed, rape-seed, etc., with the addition of a little tallow. Excellent soaps are made from palm-oil and soda. A solution of soap in alcohol, with camphor and a little essential oil added to scent it, forms a soft ointment called *sopelido*, now superseded by soap-liniment, a similar preparation, which is liquid. Medicinal soap, when pure, is prepared from caustic soda and either olive- or almond-oil. It is chiefly employed to form pills of a gently aperient antacid action.

2†. A kind of pomade for coloring the hair. [Only as a translation of the Latin.]—3. Smooth words; persuasion; flattery: more often called *soft soap*. [Slang.]

To mount on wings, or as on wings, through the air; fly aloft, as a bird or other winged creature; specifically, to rise and remain on the wing without visible movements of the pinions. The specific mode of flight is specially distinguished from any one in which the wings are flapped to beat the air; but the term *soaring* is also loosely applied to any light, easy flight to a great height with little advance in any other direction, whatever be the action of the wings, as of a skylark rising nearly vertically from the ground. In the case of heavy-bodied, short-winged birds which fly up thus, the action is often specified as *rocketing* or *towering* (see these verbs). A kind of swift wayward soaring, as of

the swallow, is often called *skimming*. Soaring specifically so called, or sailing on the air, is best shown in the flight of long-winged birds, whether their wings be either narrow and sharp, or ample and blunt, as the albatross, frigate, and some other sea-birds, storks, cranes, and some other large waders, turkey-buzzards and other vultures, eagles, kites, and some other large birds of prey. It is capable of being indefinitely protracted, either on a horizontal plane, or at a considerable inclination upward, at least in some cases; but most birds which soar to a higher level without beating the wings take a spiral course, mounting as much as they can on that part of each lap which is against the wind, and this action is usually specified as *gyrating* or *circling*.

So have I seen a lark rising from his bed of grass, and soaring upwards, singing as he rises, and hopes to get to heaven, and climb above the clouds.

*Jer. Taylor*, *Sermon*, The Return of Prayers, II.

**socialism** (sō'shāl-izm), *n.* [= *F. socialisme* = *Sp. Pg. socialismo* = *G. socialismus*; as *social + -ism*.] Any theory or system of social organization which would abolish, entirely or in great part, the individual effort and competition on which modern society rests, and substitute for it coöperative action, would introduce a more perfect and equal distribution of the products of labor, and would make land and capital, as the instruments and means of production, the joint possession of the members of the community. The name is used to include a great variety of social theories and reforms which have more or less of this character.

What is characteristic of socialism is the joint ownership by all the members of the community of the instruments and means of production; which carries with it the consequence that the division of the produce among the body of owners must be a public act performed according to rules laid down by the community. Socialism by no means excludes private ownership of articles of consumption.

*J. S. Mill*, *Socialism*.

Socialism, . . . while it may admit the state's right of property over against another state, does away with all ownership, on the part of members of the state, of things that do not perish in the using, or of their own labor in creating material products.

*Woolsey*, *Communism and Socialism*, p. 7.

**Christian socialism**, a doctrine of somewhat socialistic tendency which sprang up in England about 1850, and flourished under the leadership of Charles Kingsley, Frederick D. Maurice, Thomas Hughes, and others. The main contentions of its advocates were (1) that Christianity should be directly applied to the ordinary business of life, and that in view of this the present system of competition should give place to coöperative associations both productive and distributive, where all might work together as brothers; (2) that any other change of the laborer's life, as aimed at in most socialistic schemes, would not suffice to settle the labor question, but that there must be an inner change brought about by education and elevation of character, especially through Christianity; and (3) that the aid of the state should not be invoked further than to remove all hostile legislation. A similar scheme appeared somewhat earlier in France. The doctrines of Christian socialism, or similar doctrines under the same name, have been frequently advocated in the United States.

—**Professorial socialism.** Same as *socialism of the chair*.—**Socialism of the chair**, a name (first used in ridicule in 1872 by Oppenheim, one of the leaders of the National Liberals) for the doctrines of a school of political economy in Germany which repudiated the principle of laissez-faire, adopted in the study of political economy the historical method (which see, under *historical*), and strove to secure the aid of the state in bringing about a better distribution of the products of labor and capital, especially to bring to the laborer a larger share of this product, and to elevate his condition by means of factory acts, savings-banks, sanitary measures, shortening of the hours of labor, etc.

Socinianism (sō-sin'i-an-izm), n. [*Socinian* + -ism.] The doctrines of the Italian theologians Lælius Socinus (1525–62) and Faustus Socinus (1539–1604) and their followers. The term is in theological usage a general one, and includes a considerable variety of opinion. The Socinians believe that Christ was a man, miraculously conceived and divinely endowed, and thus entitled to honor and reverence, but not to divine worship; that the object of his death was to perfect and complete his example and to prepare the way for his resurrection, the necessary historical basis of Christianity; that baptism is a declarative rite merely, and the Lord's Supper merely commemorative; that divine grace is general and exerted through the means of grace, not special and personally efficacious; that the Holy Spirit is not a distinct person, but the divine energy; that the authority of Scripture is subordinate to that of the reason; that the soul is pure by nature, though contaminated by evil example and teaching from a very early age; and that salvation consists in accepting Christ's teaching and following his example. The Socinians thus occupy theologically a midway position between the Arians, who maintain the divinity of Jesus Christ, but deny that he is co-equal with the Father, and the Humanitarians, who deny his supernatural character altogether.

Socinianize (sō-sin'i-an-iz), v. t.; pret. and pp. Socinianized, ppr. Socinianizing. [*Socinian* + -ize.] To render Socinian in doctrine or belief; tinge or tincture with Socinian doctrines; convert to Socinianism. Also spelled Socinianise.
